There is considerable variation in yield of latex per incision, according to the time of year, or perhaps rather to the state of the weather. From observations, necessarily very incomplete as extending over only a single year, I have largely come to the conclusion that moisture is the great requirement for flow of latex: that at the wet seasons of the year the latex flows more freely, at the same time being thinner, and that therefore tapping should be done just after a spell of wet weather. To my mind the laticiferous tubes act as water stores; when there is plenty of moisture in the soil, more water is drawn up by the roots than is needed at once, and finds its way into the laticiferous ducts, to be drawn upon when required. The latex is thus slightly diluted and the vessels rendered more turgid, so that the extra pressure raised in them, as well as the thinner nature of the milk, causes a greater flow from a wound. Again, moisture may facilitate growth in thickness, and so the producing of new laticiferous elements. Nevertheless I am under the impression that in a given tube the latex may become more copious by the infiltration of water during wet weather, and that therefore the increased flow is not alone due to the formation of new laticiferous tubes.

Another point of importance is the nature of the soil as regards its retentiveness of moisture. From analysis of three soils taken from rubber plantations in Ceylon it is shown that the sample from Henaratgoda is very deficient in this water holding property. This, no doubt, has something to do with the poor yield of milk from the Hevea trees there.

In the Circular on "Rubber Cultivation" the driest parts of the two monsoons—*i.e.*, from January to April and in August and September—are considered the most satisfactory times of the year for tapping. Rainy weather is, of course, inconvenient. All the same, the tapping should be done just after a spell of wet weather, when the laticiferous system is most turgid and full of latex.

Early morning just after daybreak, is recommended as a convenient and also favourable time for tapping. Sunshine on the incisions is to be avoided, as the heat dries the latex on the wound, and is thus apt to check the flow by clogging the wound.

In the Government plantations of Hevea Mr. Lewis has noticed that the border trees, which receive most sunshine on their trunks, appear to exude latex more freely than the others, and has suggested the possibility of the sun's rays shining on the bark in the early morning exercising a stimulating effect on the flow of latex from a wound.

Sometimes we have thought to have observed the same, but when submitted to a test experiment no difference was observable between the illuminated side and the shaded side of the trunk. It is conceivable

SUPPLEMENT TO THE "TROPICAL AGRICULTURIST."

CAOUTCHOUC OR INDIA RUBBER.

CAOUTCHOUC OR INDIA RUBBER:

ITS ORIGIN, COLLECTION, AND PREPARATION FOR THE MARKET, &C.

(CEYLON ROYAL BOTANIC GARDENS CIRCULAR, JUNE, 1899.)

In two previous Circulars of this Series the cultivation, &c., of Para and Castilloa rubbers have been dealt with, and the rough method of tapping and preparation of Para rubber hitherto employed in Ceylon has been described. In the present paper is contained a report by Mr. J. Parkin, M.A., of Trinity College, Cambridge, who has been engaged since March, 1898, in scientific investigations upon rubber, its origin, flow in different species of tree, composition, coagulation, &c. The complete results of Mr. Parkin's work will be published elsewhere; the present paper is intended to place before those interested in the subject the chief conclusions which have been arrived at, together with such data as will explain them, so that those who work with rubber may at least to some extent understand what they are doing in the various processes, and, having this understanding, be themselves able to suggest improvements, or to surmount difficulties which may and will crop up in the course of work.

Those who read this paper with the intention of employing the methods described should bear first of all test them in detail themselves on a small scale, till they thoroughly comprehend both of them and the principles upon which they depend.

The measurements of bulk of liquid and of weight of product are given, it will be noticed, in the metric system, which is universally employed by all scientific workers. It is vastly more convenient to use than the cumbrous and antiquated British system, which renders all calculations into which such items as specific gravities, percentages, &c., enter, extremely complex and troublesome. A translation of the metric to British measures is given below. The unit of length in the metric system is the centimetre (cm.), the cube of this (c. c.) is the unit of volume; and the weight of one cubic centimetre of pure water at its temperature of maximum density is the unit of weight, and is termed a gramme (gm.). Thus, to make a 10 per cent. solution of salt, one takes 10 gm. and dissolves it in 100 c. c. of water.

One gm. equals 15·43 English grains; 28·35 gm. equal 1 oz. avoirdupois; 1 c. c. equals 0·06 cubic inch; 100 c.c. equal 3·52 fluid oz.; 1 cm. equals 0·39 inch; it is divided into tenths, millimetres (m.m.).

Mr. Parkin's paper follows; it is arranged under the following heads:—

A.—Botanical

B.—The Extraction of Latex.

I.—Incision

(1) Kind of Incision.

(2) Instrument to Use.

II.—Collection of Latex from Incisions.

III.—Area of Trunk to be Tapped.

IV.—Effect of Wounding on Flow of Latex.

C.—The Preparation of Commercial Rubber from the Latex.

(1) Hevea.

(2) Castilloa.

(3) Manihot.

D.—Yield.

E.—Notes on other Caoutchouc-yielding Plants.

A.—BOTANICAL.

The milky juice, technically known as *latex*, which exudes from certain plants when wounded, is quite distinct from the so-called "sap" of plants. It is contained in special tubes running for the most part longitudinally in the other tissues of the plant and forming usually a connected and closed system.

This laticiferous system or tissue is an additional development in a comparatively few families of Flowering Plants, and although not altogether absent in the vegetation of temperate regions, it is markedly characteristic of tropical floras. The natural orders Euphorbiaceæ, Moraceæ, Apocynaceæ, and Asclepiadaceæ, chiefly tropical, are specially laticiferous, and it is the first three that have so far furnished commercial rubber-yielding trees. The small order Sapotaceæ contains the trees which supply guttapercha, indigenous and almost peculiar to the Malay Peninsula and Archipelago.

Since from the latex of certain of these plants the rubber (caoutchouc) and gutta of commerce are prepared, the whole question of the formation, functions, and properties of latex is not merely one of special interest to the botanist, but also of great practical importance, especially now that the demand for these commodities is increasing while the supply is tending to diminish.

Owing to the high price which rubber fetches in the market at the present time, attention is being turned to the production of substitutes, and even to the manufacture of artificial caoutchouc itself. The latter has not as yet got beyond the stage of laboratory experiments, but the possibility of commercial success with it must be kept in view, as of course it is a point of vital interest to those engaged or intending to engage in rubber cultivation.

At the present time, then, rubber of good quality, free of dirt and moisture can obtain a good price—as much as four shillings per pound. Consequently the planting of rubber trees is a tempting occupation, and one which has in a certain measure the promise of success, provided that the trees where planted will yield latex as freely, or nearly so, as in their natural habitats, and that every care is given to the extraction of the latex and the preparation of the rubber therefrom.

Hitherto the Para rubber collected by the natives in the Amazon valley from the indigenous tree *Hevea brasiliensis*, and prepared in a special manner known as the "smoking" method, has obtained the highest price and controlled the market. The loss of weight it undergoes in manufacture is from 10 to 15 per cent., due to impurity, while other rubbers lose more, even in some cases as much as 40 per cent. Ere long this is likely to be changed. The preparation of commercial rubber has recently received attention from a qualified botanist, Mr. Biffen, of Cambridge University, with signal success. His investigations carried out in Tropical America have resulted in the production of rubber from the milk with loss in manufacture of less than 1 per cent. We shall have occasion further on to discuss his method and its application, but shall merely lay stress here on the valuable aid which scientific investigation can render to the subject. In the light of this work the commercial rubber produced by cultivators will need careful preparation so as to reduce the amount of impurity to a minimum, else its value in the market will be greatly depreciated. Scrap rubber, such as is picked off the bark, will be apt to decrease in value, while the best rubber will, on the other hand, increase. Manufacturers will find the carelessly collected material not worth the trouble and expense of cleaning when a large supply of comparatively pure and dry caoutchouc is obtainable.

Hence it behoves us to become acquainted with the important facts known relating to caoutchouc, and to endeavour to increase these by careful and systematic observation and experiment. We want to know the trees which promise best for cultivation, both as regards quality and yield of rubber. We have to consider the best times and means of tapping them, and then of preparing the rubber from the collected milk.

Before proceeding to these practical considerations and to the giving of details and conclusions of work recently carried out in the Island of Ceylon, it will be well perhaps to make a few remarks on the chemical and physical features of latex and on the structure and general arrangement of the tubes that hold it with special reference to the economic laticiferous trees, so as to approach the more strictly practical part in an intelligible manner

Latex, as its name signifies, bears a strong resemblance physically to animal milk. The white capacity of this latter is, as is well known, due to innumerable globules of butter fat held in suspension in a clear aqueous fluid so as to form an emulsion; that of latex is likewise due to minute globules in suspension, which, however, are not of a fatty nature, but consist often of resinous matter, in which case the latex dries to a brittle solid, and occasionally of caoutchouc, when it dries to the tough elastic substance known commonly as indiarubber. The latex of species of Dichopsis and Payena, genera of the natural order Sapotaceæ, has its globules composed chiefly of guttapercha, a substance identical in its percentage composition with caoutchouc, but different in its properties.

Pure caoutchouc and gutta consist wholly of carbon and hydrogen united in definite proportions. Resins, on the other hand, contain oxygen as well, and often are present along with the above two substances. In the latex of gutta trees resin occurs in considerable amount varying in different plants. The gutta prepared from *Dichopsis gutta* contains about 17 per cent., while resin that from *Payena Leerii* reaches about 38 per cent.* Similarly, but in a less degree, caoutchouc-latices contain resin. Fortunately in such trees as *Hevea brasiliensis* (Para rubber), *Manihot Glaziovii* (Ceara rubber), and *Castilloa elastica* (Central American or Panama rubber) the resinous matter is in mere traces, so that the suspended globules of these latices may be considered as consisting almost wholly of caoutchouc.

Ficus elastica (Assam rubber) on the other hand, contains a larger amount, as much as 1·58 per cent., the caoutchouc being 9·57 per cent. in the pure latex.† Several trees, notably species of Ficus (figs) and Artocarpus (jak, bread fruit, &c.), possess latex, which moulds between the finger and thumb to a very viscous substance, wholly unlike caoutchouc. This when treated with boiling alcohol yields a certain amount of resin, but it is by no means completely soluble in this medium. "Viscin" is an appropriate name given to a similar substance contained in the young shoots of *Ficus elastica*.

As far as I know such matter has not been submitted to careful chemical analysis to learn whether or not there is a substance present of the nature of a hydrocarbon (*i.e.*, containing only carbon and hydrogen), differing in properties from caoutchouc and gutta. Some latices, such as that of *Alstonia scholaris*, dry to a gutta-like mass and suggest that perhaps a member of the Apocynaceæ or Asclepiadeæ may be found to afford a useful gutta. Chemical analyses of the solid bodies of such latices are much to be desired. This is important to what will be pointed out later, viz., the difference in properties of the caoutchouc prepared from the twigs from that of the trunks of some rubber trees.

Latex, then, consists as a rule of globules or resin, caoutchouc gutta wax, &c., suspended in a watery medium.

The fluid part of the latex is not however plain water, but water containing various substances in solution. Of these perhaps albuminous matter (proteid‡) is of most frequent occurrence, and of chief importance, as will be shown, from a practical point of view. Salts, usually of organic acids, are often present. The latex of *Manihot Glaziovii* contains phosphates largely. Tannin, too, is characteristic of some latices *e.g.*, Castilloa. Generally small quantities of sugar can be recognized in analysis.

In view of the extraction of latex, a few remarks on the distribution of the laticiferous tissue in the plant seem desirable.

The laticiferous system is usually distributed throughout the organs of a plant, present alike in the stems, leaves, roots, and fruits, and is formed at a very early stage in the developing organs, so that some time ere the part is mature copious milk is seen to exude from a wound. The tubes originate in two distinct ways according to the kind of plant.

In one case exhibited by Hevea and Manihot the laticiferous vessels arise from series of sacs (cells) arranged for the most part longitudinally. The separating walls (septa) between the contiguous cells break down, the original protoplasmic contents transform into or rather secrete the latex, and the result is a number of communicating tubes full of a milky fluid. The more complete the dissolution of the intervening partitions between the original separate elements, the more perfect is this form of laticiferous system, and the better the flow of latex from an incision. This, of course, is an important practical point. In gutta trees the laticiferous sacs, although they lengthen considerably, never communicate one with another; hence the difficulty of extracting the latex in quantity. The whole trunk has to be cut all over, thus sacrificing the tree, in order to obtain the guttapercha.

The other type of laticiferous tissue is that shown by Castilloa, Ficus, Euphorbia, &c.; in fact, it is characteristic of the orders Moraceæ, Apocynaceæ, and part of the Euphorbiaceæ, the other part possessing the articulate system as it is called, which has just been briefly described. Instead of the laticiferous tubes arising *de novo* in the growing organs, the tubes present in the mature parts send branches into them. In fact, it has been established for several of these plants that the laticiferous system is laid down once for all in the seed in the form of a certain number of initial cells. Each of these commences branching in definite directions and keeps pace with the growth of the plant. Consequently this kind of system is throughly intercommunicative from the commencement and remains so. Hence as a connected system this is more perfect than the other, and the latex flows as a rule more freely from such plants. This may partly account for the much better yield of latex from an incision in the bark of Castilloa than in that of Hevea or Manihot.

The laticiferous system in the stem, the part of the plant of importance for rubber production, occupies definite positions.

In the stem bearing leaves the laticiferous ducts are situated as a rule in greatest abundance just without the vascular cylinder, the part between the pith and the external soft portion, the cortex. A lesser development may occur just within the outermost limiting layer of cells, communicating with the former at the nodes—*i.e.*, the points where leaves are attached to the stem. There may also be a third development in the pith very noticeable in such climbers as Landolphia. The first, however, is the important one to consider here.

After the primary growth has ceased, the stem begins to grow in a definite manner to thickness only; this is known as "secondary thickening" and continues during the whole life of a tree. The active part is situated between the bark and the wood and is known as cambium. The cells which compose it give rise on the internal side to new wood and on the external side to new bast, which goes to form a new addition to the bark. The older parts of the bark are continually being shed by means of a special cork layer. In laticiferous trees the laticiferous tubes continue to appear in each fresh addition to the bast by the cambium. Consequently the newest tubes are situated in the innermost part of the bast next the undifferentiated active layer of cells the cambium. In Hevea and Manihot the tubes arise afresh from certain [illegible] cells, in the same way as they do during [illegible] growth in thickness, e.g. new branches are given off from [illegible] and secondary tubes, which penetrate and ramify through the new bast.

The latter plants due to as they are pushed outwards by the growth of the stem, become crushed and dried up, so that the flow of latex from them is

* See Report of this paper following after it—J. P.

† See Report of this paper following after it—J. P.

‡ A very complex class of nitrogenous compounds common to all living matter [illegible]

diminished or stopped. It is the last formed ducts—*i.e.*, the innermost—that flow freest when wounded. An incision must then extend as far as the cambium, in order that the latex may exude plentifully, but it must not extend into the wood, else the wound will be liable not to heal completely. In the Hoveas growing in the Peradeniya and Henaratgoda Gardens the bark can be penetrated for about ¼ inch (4 mm.) without latex exuding. Taking the thickness of the bark at 3 inch (9 mm.), which is about the average for the Peradeniya trees, the latex flows chiefly from the inner ⅓ to ⅓ inch (2 mm. In Manihot and Castilloa milk exudes when the tissue just within the dead outer bark is penetrated. The difference between these two and Hevea in this respect is rather striking. It thus seems that the outermost laticiferous ducts in Hevea soon become dried up. It would be interesting to know whether the bark shows the same feature in trees growing in their natural habitat, the Amazon Valley, or in other places where they are cultivated.

Having now given a brief account of the chemistry of latex and of the anatomical features of the apparatus holding it in the plant a few words on the very debatable point—its function—may not be out of place here.

From the comparison of laticiferous plants with their near relations, which do not possess true milk ducts, and from the origin of the system in the plant itself, the laticiferous tubes appear to be near akin to what are known as excretory sacs—special cells set apart to hold tannin, resin, &c., substances considered to be excretory and of no further use to the plant in the way of food. The globules of latex, then, consisting of resin, caoutchouc, &c., represent the excretory part. Accepting excretion as the primary function of the laticiferous tissue, this complex system of communicating tubes must, one would think, have been evolved to perform some additional function or functions. Since latex often contains such valuable food stuffs as proteids and carbohydrates (sugar and starch), the view of the tubes being channels for conducting these materials or for the storage of them is one which has much support at present. Personally I am not inclined to look upon latex as playing an important part in nutrition, and should imagine that if it were possible to extract all the latex from such a tree as *Hevea brasiliensis* without greatly injuring the other tissues, it would not be seriously harmed. I am inclined to regard the laticiferous system more as channels for holding water in reserve to be called upon during times of drought or during the dry season.

B.—THE EXTRACTION OF LATEX

Having seen that in a rubber tree the laticiferous vessels occur throughout the plant, being present in the root, leaves, and young fruit, as well as in the stem, and appearing also in the new bast which arises through the secondary thickening of stems and roots, it is natural to inquire which is the best part of the plant from which to extract the latex for the preparation of rubber.

In a few laticiferous trees, not however well known caoutchouc-yielding ones, the main trunk and branches exude no latex when wounded. An example of such growing at Peradeniya is *Alstonia macrophylla*; only its leaves and twigs are laticiferous. Another species, *A. scholaris*, a native of Ceylon, on the other hand, possesses copious latex in its trunk. In such an exception as the above it looks as if the laticiferous ducts are only formed in the primary tissues and not in the last among from secondary thickening. *Alstonia plumosa* of Fiji is said to produce rubber, but only from the young branches, and so seems to resemble the above mentioned *A. macrophylla* (*Kew Bull.*, July, 1898). Other examples of plants devoid of latex in the thickened stems are *Coduvum tuberculatum*, *Ficus stellulata*, *Croton tiglium*.

The main trunk or branches are the parts which have furnished commercial rubber in the past, and are naturally the most suitable to the native collecting it from already grown forest trees or climbers, but with cultivators the need of waiting several years—at least six in the case of Castilloa and ten in that of Hevea—before the trunks of the trees are fit for tapping, is a serious item, and well may we consider whether any other part of the plant could be made to yield rubber of good quality and in sufficient quantity to pay the cost of extraction.

The root need hardly be considered, as its situation does not lend itself to tapping, although quite recently some new rubber plants have been discovered in Africa, viz, *Carpodinus lanceolatus* and *Chilandra henriquesiana*, belonging to the natural order Apocynaceæ. These are herbacious with thick underground stems, full of latex, from which the natives extract the caoutchouc by rasping them and then boiling. Dr. Morris mentions them in his Cantor Lectures on the commercial sources of Indiarubber, delivered in 1898, and suggests that they might be useful for cultivation, since they would reach maturity [illegible] give more copious flow than other rubber plants.

The only other parts of the plant besides the trunk and main branches of such trees as Castilloa or Hevea, which might be used for the extraction of rubber, are the young shoots. If these could be used profitably, then a return on the capital could be obtained in a year, either by growing crops of seedlings or by coppicing permanent plants. Our attention has been applied to this with, however, no encouraging results.

Hevea brasiliensis will not answer at all, as far as our experience goes, for three chief reasons:—

(1) The exudation of latex is small.

(2) When the shoots are crushed the latex does not freely come out and mix with water, but clots where it exudes in little lumps, which cling to the broken piece [illegible], consequently the latex cannot be collected in any quantity for the preparation of rubber from it. This clotting as it exudes in young stems is perhaps due to the presence of organic acid occurring in the surrounding tissue and freed in the crushing, so as to mingle with the latex. A trace of acid readily coagulates the latex of Hevea.

(3) The rubber collected from the young stems and leaves has not the same quality as that procured from the trunk. It is somewhat adhesive with less elasticity and strength. In fact, the essential properties of caoutchouc are not well exhibited by this rubber obtained from the younger parts of the plant. The same is true for the rubber obtained from the unripe capsules, the outer part of these being especially rich in latex. Whether the defect is in the caoutchouc itself or due to some other matter present, has not been definitely ascertained. Most likely it is due to a difference in the chemical nature of the globules of latex themselves. When some of this latex is boiled well with alcohol and then filtered, and the clear filtrate mixed with water, only a slight milkiness is observed, pointing to a trace of resin, the latex of the trunk behaves similarly just containing a trace of resin. Hence the poor quality of this rubber from the young parts does not seem to be brought about by the presence of a larger amount of resin or other matter soluble in alcohol. Accepting the view of the globules being not true caoutchouc, the extraction by chemical means would not result in a substance of better quality. Consequently, in our opinion the extraction of rubber from the shoots of Hevea is not feasible.

In Castilloa the latex from the stems bearing leaves as well as from the leaves themselves [illegible] between the finger and thumb into a very sticky substance, wholly unlike the caoutchouc occurring latex of the trunk. Some of it was collected in tubes and mixed with water, whereby the solid particles sank to the bottom in small clots instead of floating to the top; these were removed and dried on a porous surface, and formed a brittle substance without any elasticity or extensibility, and which becomes viscous when slightly heated, as when pressed between the fingers. Its solubility in boiling alcohol was tested and compared with that from the trunk, more resin of the kind soluble only in hot alcohol was indicated in the sample from the young stems. In the shoots, then, the caoutchouc appears to be replaced by the substance, which we have called "viscin," so common in other laticiferous plants, and to a certain extent by resin also.

The quality of the rubber from stems of about 5 to 10 inches (12·5 to 25 cm.) in circumference has also been roughly tested. The collected latex was mixed with water, when the solid particles floated up to the top in the form of a cream. This was removed, mixed up again with water and recreamed, and then dried on a porous surface. The sheet of rubber obtained was slightly sticky and deficient in elasticity and strength. When pulled it extends fairly readily, but when let loose does not spring back smartly like ordinary rubber, but contracts gradually. It resembles the rubber of Hevea shoots and is intermediate between the true caoutchouc of the Castilloa trunk and main branches, and that of the shoots. This is an important point practically, for at any rate as far as the Castilloas are concerned, no rubber of good quality can be extracted from the plant till the trunk has attained a considerable thickness; rubber is not procurable from the shoots, its place is taken by a viscous body, wholly lacking in the essential properties of caoutchouc. This only applies to the Castilloas of Ceylon. We have not had an opportunity of examining them in other countries, although one would expect similar differences to occur elsewhere. Our Castilloa seems not to be the species *elastica*, but a very closely allied one, *Markhamiana*; the true *C. elastica* may not show this marked difference between the latex of the shoot and trunk. From an article in the *India-rubber World* reproduced in the *Tropical Agriculturist* for December, 1898, p. 381, on some recent developments in rubber cultivation, one would conclude that the Castilloas growing in Trinidad possessed proper caoutchouc in their young stems. The second paragraph is here quoted in full:—

> The most interesting point under discussion in relation to rubber-planting in the British West Indies is a series of experiments now being carried on in London and Trinidad, by which it is proposed to secure rubber from year-old trees of *Castilloa elastica*. It has been found that seeds sown broadcast over a prepared field will yield an abundant crop of young trees, which at about a year old can be cut and sent to a factory, where, with ordinary machinery operating a simple process, 8 per cent of fine rubber can be extracted from the young shoots. This can be done in the laboratory. It is claimed that the process is a simple one, that but little machinery is necessary, and that in future the world's rubber supply will be secured from an annual crop of young trees sown on cultivated estates and not from remote forests as at present. A series of experiments has shown that the young tree contains about 8 per cent. of rubber, which would, at present prices, return an estimated profit of $200 to $400 per acre. The extraction of rubber from young shoots has been accomplished chemically in the laboratory, but whether it can be applied to the economic production of rubber on a large scale remains to be seen.

In *Manihot Glaziovii* (Ceara rubber) the latex of the shoots appears to form as good a rubber as that from the trunk of the tree, so the objection to the extraction of rubber from the young parts, owing to its inferior quality, does not apply here. However, we hardly consider that it would be profitable to extract the rubber from the young stems and leaves either by mechanical or chemical means.

Even if the caoutchouc could be procured from the twigs by a chemical process in paying quantities, it might possess the same defect as guttapercha obtained in this way, viz., lack of durability. The late Dr. Obach lays stress on this in his Cantor Lectures on Guttapercha delivered in December, 1897, (p. 49). The gutta is dissolved out of the pounded leaves by such solvents as carbon bisulphide and petroleum spirit, and then recovered by precipitation or evaporation from its solutions. Commenting on these processes he says—"Hitherto no satisfactory mechanical process has been proposed for that purpose, chemical methods have to be resorted to, as we have seen. This I consider to be a disadvantage, inasmuch as the durability of the guttapercha, particularly on exposure to air and light, is thereby imperilled."

In the case of gutta, there is good reason for attempting its extraction from the young parts, because the trees, owing to the laticiferous elements being closed sacs and not communicating tubes, have to be cut all over—in fact killed—to obtain as all the gutta; they cannot be tapped in the same way as rubber trees, they are of slow growth, and consequently are rapidly diminishing in numbers, in fact, the best tree, *Dichopsis gutta*, is practically extinct now, except in botanical gardens and such places. On the other hand, with respect to rubber trees, there are not these drawbacks, some are of quick growth, yield copious latex when tapped, and such as Hevea exist in great numbers in their natural habitats.

In our opinion it seems hardly likely, at any rate as far as Ceylon is concerned, that rubber can be extracted profitably from the leaves, twigs, &c., so we must return to the consideration of the main stem and consider the best means of extracting the latex from this.

I.—INCISION.

Two chief points come up for consideration here, viz., the kind of incision, and the instrument with which to make it.

(1) KIND OF INCISION.—In order to obtain the latex from the trunk of a rubber tree the latex vessels have to be cut in some way or other. The question naturally arises as to what is the best kind of wound to make in order to extract the maximum amount of latex with the minimum of injury to the tree. Now the milk tubes situated in the inner bark (bast) run for the most part longitudinally. It stands to reason that an incision made horizontally will yield more latex than a similar one made vertically, because a greater number of tubes will be severed in the first case than in the second. An oblique incision is, however, on the whole preferable to a truly horizontal one, for the milk stream is directed to one point, the lower end of the incision, whereas in the transverse cut the milk is apt to trickle from more than one point, usually from the two ends. Whether the latex be collected from each incision separately the best plan if it flows at all freely or whether it be collected at the base of the tree from the streams issuing from a number of vertical rows of incisions, the inclined incision will prove less labour to dry on the tree than the horizontal ones, for, as a rule, in the one case the latex soon runs out in a single stream, whereas in the second case it makes two streams that is, on the assumption that the amount of latex flowing out of each kind of incision is the same.

The two following experiments on *Hevea brasiliensis* illustrate the differences between the amount of latex collected from vertical, horizontal, and oblique (—\) incisions:

(1)	Twenty one vertical incisions gave	8·5 c. c. latex
	Twenty one oblique " "	18·5 c. c. "
(2)	Fourteen horizontal " "	6·0 c. c. "
	Fourteen oblique " "	12·0 c. c. "

Mr. Hilley, Director of the Botanic Gardens, Singapore, has kindly informed me that the average thickness of the trunk bark of Hoveas there, 21 years old, is ¾ inch.

A very noticeable point in these figures is the very small yield of latex per incision. These experiments were performed perhaps at Attion (March 6, 1899) when the latex was running less freely than at other times, but the average amount is not greatly above this at any period of the year, so far as our observations go at Peradeniya and Henaratgoda. Further remarks on yield of latex [illegible] are reserved for another section of this paper; in the meantime we make experiments much more with all the latex collected separately from each incision into a known volume of water contained in a suitable vessel. After the flow had ceased the contents of the vessels received in the latex from one kind of incision were poured into a measuring cylinder and the volume read off, the amount of latex is then arrived at by subtracting the quantity of water previously added from the total fluid.

Care was taken to have corresponding incisions (of the different types at the same level of the stem on the same trees.

In both cases the oblique incision yields about double that of the other. There seems little difference between the amount collectable from a vertical and horizontal incision. Although there is a greater output of latex from the horizontal cut, yet much more dries on the wound than in the case of the vertical, consequently the amount which drops into the receiver comes to about the same in the two cases.

Having assumed, then, that the oblique incision is the best, the next point to be considered is whether or not it should be single or double. A double incision made in the form of an upright V has been largely employed, and is the one which has hitherto been used for tapping Hoveas in the Botanical Gardens of Ceylon. Experiments on the relative quantity of latex collectable from single oblique incisions and from double ones in the form of a V have shown that for Hoveas growing at Peradeniya and Henaratgoda the latter yield usually about double the amount that the former do. *[illegible]*

Experiment at Henaratgoda February 3, 1899.

Twenty-one single oblique incisions (/) gave	16·5 c.c. latex	
Twenty one double " " (V) "	32 c.c. "	

The latter just about double the former.

Two Experiments at Peradeniya.

On October 19, 1898, six trees used:—

Twelve Vs gave 60·9 c.c. latex

Twelve /s gave 58·5 c.c. "

On October 20, 1898, seven trees used:—

Fourteen Vs gave 61·8 c.c. latex

Fourteen /s gave 32·3 c.c. "

The latex in these last two experiments was collected separately from each incision in test tubes fixed below. By measuring the height of the latex in each tube and then estimating afterwards the volume of water required to reach up to this height in the tube, the quantity of latex was ascertained, a method more accurate than the other one previously described; but since test tubes can hardly be used for collecting latex on a large scale the special tins employed for this are perhaps better used for experimental purposes. Besides, we have not always had a supply of test tubes at our command.

The trees in these two last experiments, as the numbers show, were flowing much better than those at Henaratgoda, and the difference between single and double cuts is much less marked. In the first case it is very slight, in the second case the Vs gave about half as much again as the single cuts; and it is to be noticed that the total amount of latex is considerably greater for the former than the latter.

This suggests that if the trees run well, any 5 c.c. (for oblique incision, then very little more latex is obtained by doubling the incision in the form of a V; whereas if the flow is poor, then a V gives about double that of a single oblique cut. It looks as if in the one case a single incision drains about the same area as a V, while in the other case it drains about half only. If, then, the trees flow pretty freely, single oblique incisions are sufficient; the extra injury done, which is considerable, and the time taken in making the second half of the V, is not compensated for by the small additional amount of latex obtained. If, on the other hand, the flow is small, as in the experiment at Henaratgoda, then Vs should be employed in preference to single cuts.

The above remarks refer only to Hevea. Manihot has not been tested in this way, but, judging from their yield of milk per incision, we should imagine that Vs had better be employed than single oblique cuts. Castilloa, on the other hand, flows as a rule so much more freely from an incision than Hevea, that a V cut is wholly unnecessary.

One objection to the V shaped incision is the liability of loosening the piece of bark it encloses when the second half is made; this loosening is apt to retard the healing of the wound, or even to prevent in some cases complete cicatrization. To obviate this, an X incision has been suggested. We have tried this, comparing the amount of collectable latex it gives with that of a V.

Experiment at Henaratgoda March 3, 1899.

Twenty-four V-shaped incisions yielded	42 c. c. latex	
Twenty four X-shaped "	24 c. c. latex	

The Vs give nearly double that of the Xs. An X incision naturally flows from the two lower ends in two streams, thus more latex dries on the tree than in the case of the V; also the upper half of the X would seem to drain pretty nearly the same area of bark as the lower half. Thus these two points may explain why the V cut should give so much more latex than the X. There seems little doubt, then, that if a double cut is to be made, the V form is the best.

(2) INSTRUMENT WITH WHICH TO MAKE THE INCISION.—For most of our experiments we have used an ordinary carpenter's chisel and a mallet. The natives employ for tapping the Para rubber trees in the Amazon Valley a sort of hatchet with a blade not more than 1½ inch (3 cm.) in width, which rapidly thickens from the cutting edge so as to form a kind of wedge. The incisions are made in the bark by striking in an obliquely upward direction with the tool. After each blow a small vessel is quickly fixed by means of clay below the cut to collect the milk. The wedge-like shape of this small axe is a check against making the incision too deep, so as to penetrate the wood,—a point always to be guarded against.

Considering the smallness of yield of Hevea trees in Ceylon as compared with the ones in their native country, such a hatchet seems rather too rough a tool to use, as, without much practice, the blows could not be so regulated as to ensure the latex always flowing straight into the vessels placed beforehand, and the impacts would be apt to loosen these. To fix the collecting cup after making the incisions requires some dexterity, in order not to lose any of the latex. It is an advantage to have these attached to the bark beforehand, and then to make the incisions just above them; to effect this a chisel and mallet have been found very suitable.

A chisel with a slender blade makes a narrow incision, which is liable to become clogged with rubber, thus stopping sooner the outflow of latex; the wood is also easily penetrated by it. On the other hand, a chisel with a somewhat wedge-shaped blade makes a gaping incision, which tends to allow the latex to run longer, and is not easily driven into the wood. An ordinary carpenter's chisel may be considered as intermediate between these two.

Experiments have been tried to see whether incisions made with a stone or cold chisel gave more latex than corresponding ones made with an ordinary chisel. Each chisel measured 1½ inch (33 mm.) in width. The carpenter's chisel had a thickness of ½ inch (13 mm.) at a distance of a ¼ inch (6 mm.) from the cutting edge. The stone chisel had a thickness of ⅝ inch (16 mm.) at a similar distance, *i.e.*, just double the other. The carpenter's chisel is as it were half wedge-shaped in section, while the stone chisel is full wedge-shaped; or, in other words, the one is bevelled only on one side, the other on both.

The result of the experiments showed no appreciable difference in the amount of latex collected from the two kinds of incisions of the single oblique cutter. It was noticed that the stone chisel was apt sometimes to crack the bark, and consequently the latex was then liable to flow out in wrong directions. It is also naturally more difficult to drive into the bark; an obvious disadvantage in every way, preventing the penetration of the wood.

We should be inclined, on the whole, to recommend an ordinary carpenter's chisel (or perhaps better a wedge-shaped chisel) with a thickness of ⅜ to ½ inch (6 to 8 mm.) at a distance of ¼ inch (13 mm.) from the cutting edge. The breadth of the chisel may vary from 1 to 1½ inch (25 to 37 mm.). It seems hardly necessary to have a chisel with a guard, for the [illegible] on the trunk. Unless the guard were the age of the tree and to the height on the trunk. Unless the guard were movable, the chisel, being naturally always driven in up to the stopping place, would sometimes penetrate the wood, if the bark happened to be thinner than usual, and if thicker might not reach the innermost milk ducts the ones which flow the freest. With care and a little practice the chisel and mallet can be used so as just to reach the cambium and no further. The blows should be lightly dealt, and stopped as soon as any increase of resistance is felt.

The above remarks refer chiefly to *Hevea brasiliensis*, but apply equally well to *Manihot Glaziovii* and to Castilloa. The last-mentioned has a much thicker bark, measuring ¾ inch, whereas the bark of corresponding Hoveas measures ¾ inch, just half that of Castilloa.

II.—THE COLLECTION OF THE LATEX FROM THE INCISIONS.

In Circular No. 4 of this Series, January, 1898, on Rubber Cultivation in Ceylon, the method hitherto employed for collecting the latex is described. A mud gutter is formed round the base of the tree, and the streams of latex flowing from the V-incisions made in vertical rows reach this gutter and ultimately collect in coconut shells stuck here and there under spouts made in the mud. This method is faulty in several respects. A quantity of latex dries on the tree, often as much as half, and the rubber resulting from it when peeled off is full of small particles of bark; consequently its value is much lessened. The latex collected in the coconut shells is also apt to be contaminated with dirt and bark, which cannot be readily removed. This latex takes a long time to dry as it is in a thick condition, and during the drying it putrefies and becomes smelly, giving off a sickening smell. This putrefaction deteriorates the quality of the rubber, and is very objectionable. A better plan, then, is to collect in a separate vessel the latex exuding from each incision. We have now to consider what may be a suitable kind of vessel, and what is the best means of fixing it into the bark.

We have designed a small tin vessel, which seems to answer very well, and it can be made at a cheap rate and is light in weight. It is half cylindrical in shape (see figures at end), 2 inches (5 cm.) long by about 1 inch (2·5 cm.) broad. Near the top of the flat side a small spike is soldered in, which projects about ¾ inch (5 mm.) outwards. The tin holds about 30 c. c.: as far as our experience goes of yield of Hevea trees in Ceylon, the tin might easily be made a third less in size. The tin is fixed on the bark by pressing in the spike with the thumb. To prevent the latex from trickling down between the bark and the tin, some plastic material is needed to lute the upper edge of the tin to the bark. Fine clay will do, but it is open to the two following objections. As it contains water the latex is apt to suffuse over and soak into it, and as it soon dries and cracks the tins cannot well be fixed some time beforehand. Putty overcomes the first objection, but not the second. We found in the laboratory at Peradeniya a greenish putty-like substance, which does not harden, but is permanently plastic and readily moulds like soft wax into any shape required.*

This is a very satisfactory material, and can be used over and over again. Hearn is taken to remove the small amount of rubber which dries upon it at each incision. A little of it is rolled between the palms of the hands into a "worm"; this is stuck to the bark in the form of a curve, with the concave side uppermost. The spike of the tin is pressed into the middle of this, and then with the finger the plastic material is pressed down so as to form a smooth surface over which the latex will run. The two ends of the worm are turned up as a safeguard in case the latex should trickle from other points besides the lower end of the incision. A lid is put over the mouth of the tin and the incision made just above, and then the lid removed. The lid prevents the particles of outer bark, which fly off as the incision is being made, from falling into the tin.

For Castilloa a tin of the same pattern has been used, but about three times the (size 100 c.c. capacity) and with a stouter, and longer (3 in.) spike, necessary for pressing into the harder outer bark and for supporting a greater weight. The tins can be fixed some time beforehand. Since tapping is best performed in the early morning, the tins can be luted on the previous evening. For this reason it is perhaps best to have each tin provided with a lid, so as to keep out dirt or rain. The lid should have no downward projection on the straight sides, so that it can be easily slipped on and off.

In the case of Hevea, a little water should be put into each tin to prevent any of the latex from drying. If the flow is copious, such as 10 c.c. per incision or more, then the water may be unnecessary. By applying this method of collecting the latex to trees which exude very poorly, we have found that the small quantity of latex which flows into the tin lies on the surface of the water and is very little to form a clot. Stirring prevents the clotting, but this entails extra labour. A better plan is to use slightly ammoniated water; this has been found to prevent as a rule any putrefaction for two days, and is more readily obtainable than carbolic acid. About one part by volume of the ordinary solution of ammonia in 100 parts of water is enough. It is best to add to each tin the same amount of liquid. A little vessel, such as a small glass to be which holds 5 c.c. or under, is convenient. This is filled with the ammoniated water for each tin and emptied into it. When the wounds have ceased trickling, which varies greatly according to the state of the trees, sometimes only a few minutes, at other times as long as an hour, the tins are detached one by one, stirred, and their contents emptied into a large receiving vessel through a coarse cloth sieve fastened over the mouth; this filters out any particles of bark or rather fungi matter which may have fallen into the tins. Each tin can be rinsed out with a little water, and the rinsings added to the rest of the diluted latex, which after another filtering is ready for the extraction of the rubber.

In the case of Castilloa it is not necessary to add just a little water to each tin. The latex has no tendency to clot. The exuded one particles being much larger than those in Hevea, segregate from the liquid part, which in contact with the air rapidly darkens to a beer-like fluid. The latex as it first flows out is quite white, but, owing to the formation of a dark soluble colouring matter by means of the fixation of the oxygen from the air, it rapidly becomes of a dirty brown colour. Usually the flow at first from an incision is rapid, but owing to the segregation of the caoutchouc globules the liquid part of the latex is apt to leave some of the solid particles behind so that the wound becomes covered with a mess of thick creamy latex. This should be drawn down into the tin, when the latex has ceased to flow. The latex from all the tins is collected together and the washings added, and the whole passed through a sieve to free it of pieces of bark, &c. A metal sieve, such as is used for milk, answers better than a cloth one for Castilloa. The latex should be brought to a dilution of about five times with water, and is then ready for the extraction of its rubber by creaming, which is discussed further on.

III.—THE AREA OF THE TRUNK TO BE TAPPED.

Two points claiming consideration here are—firstly, what extent of the bark of the tree should be tapped at one time; and secondly, how far apart should the incisions be made?

(1) In the first place respecting *Hevea brasiliensis*. On theoretical grounds it seems hardly desirable to tap all round the trunk of a tree at one time, but better to tap one half of the surface, leaving the other half intact for another year or tapping season; thus there will be no risk of ringing the tree. The food materials formed by the leaves will have an uninterrupted path on one side of the tree, whereby to pass for the nourishment of the roots. Hitherto the tapping at the Gardens has been always carried right round the trunk at one time. We now suggest this other way as being perhaps more expedient. In the Amazon Val

The Planters' Association of Ceylon,

KANDY.

FORTY-SIXTH ANNUAL REPORT.

FOR THE YEAR ENDING 17TH FEBRUARY, 1900,

Your Committee, in discharge of its duty, herein begs to submit the forty-sixth Annual Report of the Planters' Association of Ceylon. As the new year will be memorable in the annals of your Association by virtue of entering into possession of Buildings henceforth to be Headquarters, and the place where meetings are to be held, when such are called in Kandy, it may be interesting and useful to recall briefly and thus give prominence to a few facts relating to the early years of your organization before proceeding with the customary review of the work of the past year.

The Planters' Association of Ceylon was established at a Public Meeting held at Kandy on the 17th February, 1854, for the furtherance of the agricultural interests of the Colony, and has since continued the beneficial work thus inaugurated with great advantage to the planting community, and for the general good of Ceylon. One of the earliest acts of the Planters' Association was to memorialize Government as to the urgent and growing necessity for railway communication with the sea coast, that is, Colombo. So vital was the question deemed that the then memorialists had no hesitation in giving an assurance "that to obtain the unspeakable advantage of a railway the planting community would consent that an export duty be imposed on coffee sufficient to meet any amount in excess of which the Government may be able to pay." It would scarcely be credited that the Railway—Colombo—Kandy, persistently agitated for nearly half-century ago—has been built, is a monument of engineering skill, and is probably the best paying railway in the world. In proof of this the annexed statement from the Administration Report (Railways, 1898) is given, showing the revenue earned by the Railway from time of opening to date; also the net amount which has been available for Colonial purposes after paying interest on loans and sinking fund, and a table giving the capital outstanding on Railway loans.

It may be incidentally noticed that the well-known bridge over the Mahawili Ganga at Katugastota was successfully pressed for by the Planters' Association about 1855. Another matter that early engaged, as it has continued to engage, the serious attention of the Planters' Association was the difficult question of labour supply and the line of road for immigrant coolies *via* Mannar. In this connection railway extension northwards lately sanctioned will tend to greatly improve facilities for travelling, and be the means probably of maintaining an alternative route to that *via* Tuticorin for immigrant coolies. As regards other means of communication, the Planters' Association has always taken a lively interest in roads. In 1856 application was made to Government for a Commission of Enquiry to consist of nominees of the Government and nominees of the Planters' Association to sit in Kandy and to take evidence and to report as to the best means of placing District Roads under trust management, with the result that ultimately an Ordinance was framed and the Provincial and District Road Committees constituted through which substantial benefits have accrued. Closely connected with the subject of the labour supply has been that of the Labour Laws which from 1864 onwards has from time to time occupied a share of the earnest attention of the Planters' Association. There have been occasions when the relations between the Planters' Associations and Government have been somewhat strained, but difficulties having been overcome, on the whole the existing laws work well and have tended to maintain satisfactory relations between employer and employed. The latest step taken by the Planters' Association has been the establishment of a Labour Federation, with the object of checking the steady increase in the amount of so-called "Coast Advances", and for mutual co-operation and conference. One other matter of ancient history that may be mentioned is the privilege extended to the Planters' Association by Sir Henry Ward during his term of office as Governor, of nominating for approval a member to represent Planting Interests in the Legislative Council, and which has been continued by successive Governors of Ceylon with the best results.

Turning to the work of the past year, your Committee notes with satisfaction that the Register compares well with previous years, the number on the Roll at date being 946. There have been eight meetings of the Committee representative of all Districts, and two General Meetings of your Association. On Agricultural matters generally and the various questions that have been considered during the year your Committee records the following *resumé*:—

PLANTING PRODUCTS.

TEA.

Last year may be said to have been a wet season as compared with the previous year, with the result that the Tea harvested exceeded estimates generally. Your Committee estimated the Tea Crop for 1899, after allowing 1,500,000 lbs. for local consumption, at 125,000,000 lbs. available for export, but the exports, according to the Chamber of Commerce Returns, amounted to 129,894,150 lbs. or nearly 5,000,000 lbs. more than the estimate. Your Committee appends interesting statistics from various sources for reference. Under date London, December, 1899, Messrs. Gow, Wilson & Stanton report: The increase in Home Consumption during the past 11 months is very marked, being more than 8 millions above the corresponding period last year; the fact that all growths show an increase, and not only those from India and Ceylon, is probably due to the strong demand for low priced Teas.

Movements of Tea in United Kingdom from 1st January, to 30th November, as shown by Custom House Returns.

Stock of all Tea in United Kingdom at the end of Nov. 1899, 103,348,000 lbs. 1898, 91,198,000 lbs. 1897, 91,095,000 lbs.

The most noticeable feature in the history of the Tea trade during 1899 was the advance in value of low priced Teas which commenced early in the year. The rise, with various fluctuations, has been maintained, and this class of Tea is now something like 20 % dearer than in 1898. The altered position was mainly brought about by the sustained demand for cheap Teas, which thus gradually absorbed the lower grades. This has now to a great extent necessitated the withdrawing of the much advertised cheap canister, a fact which may prove of lasting benefit to the trade. The average price has, however, not advanced to the extent which might have been expected, owing to lower quotations for better class grades.

Production of Tea in India and Ceylon during 1898 barely equalled consumption, while although estimates of the 1899 crop point to a larger supply, consumption both at home and abroad has so materially increased that it is doubtful whether the surplus will be heavy. The outlook for producers is decidedly more cheerful than a few years ago, when overproduction was feared. HOME CONSUMPTION.—The elasticity so long noticeable has again been remarkable, coming as it has done after recent increases. The total of all Tea consumed in the United Kingdom during 1899 was about 244,000,000, lbs. against 235,414,105 lbs. in 1898, and lbs. 231,399,788 in 1897. British Grown Tea contributing 231,000,000 lbs. in 1899, against 215,902,090 lbs. in 1898, and 210,027,748 lbs. in 1897. The following table shows the increase in the various growths:—

	1899.	percentages.	1898.	percentages.
Indian ...	136,000,000	56	133,430,351	57
Ceylon ...	85,000,000	35	82,471,745	35

Other Countries	6,500,000	2	4,816,675	2
Total lbs.	244,000,000		235,414,105	

	1897.	percentages.	1896.	percentages.
Indian ...	124,584,194	54	122,941,098	54
Ceylon ...	85,493,554	37	80,294,475	35
China ...	17,242,247	7	19,831,680	9
Other Countries	4,129,783	2	4,718,256	2
Total lbs.	231,399,778		227,785,509	

The quantity per head of population in 1899 was 6·01, against 5·85 lbs. in 1898, and 5·81 lbs. in 1897. NEW MARKETS.—Considering the higher prices ruling for the lower grades, much increase could hardly have been expected in foreign outlets. The substantial progress made is therefore the more gratifying, the total quantity exported to these markets during 1899 being about 68,000,000 lbs. against 62,429,839 lbs. in 1898, and 54,148,124 lbs. in 1897. The development since 1890, when only 14,000,000 lbs. were taken outside the United Kingdom, has been very marked, a circumstance which goes far to show the estimation in which British grown Tea is held. TRADE DISPUTE.—The trade was considerably disturbed in July through a dispute between importers of Indian and Ceylon Tea and their buyers; this was chiefly owing to economy necessitated by the poor results obtained by producers during the last few seasons. Importers wished to do away with the allowance for draft. Trade was almost entirely checked for about a month, when a resumption took place on the belief that a satisfactory settlement had been arrived at to come in force a few months later, but delays have since occurred so that the actual time has not yet been definitely fixed. CEYLON TEA.—The quality of the crop was somewhat on a par with that of 1898. The quantity exported from Ceylon in that year was 119,769,071 lbs., of which 96,133,833 lbs. came to London, while the supply in 1899 will probably total 127,000,000 lbs., of which 101,000,000 lbs. may come to London.

The average price for Teas sold in London on garden account was 7·96d. in 1899, against 7·76d. in 1898.

EXCHANGE averaged 1/4 15/32 during 1899, against 1/4 7/32 in 1898.

Messrs. George White & Co., London, in their Ceylon Tea Memoranda of January, 1900, state that the quantities offered at Public Sale in the past three years were:—

Sold in London from

1st Jan. to 31st Dec. 1899...1,138,100 pkgs. realizing 8d. per lb.
" " 1898...1,108,800 " " 7 3/4d. per lb.
" " 1897...1,138,000 " nearly 8d. per lb.

so that a slightly larger total was disposed of in 1899 at a fractionally higher price than in the year before, which is encouraging, considering some of the adverse conditions encountered, notably the dispute regarding the 1 lb. draft, &c., which paralyzed trade throughout July, and later on dear money. The quality of the crop did not differ materially from that of the foregoing season, and was of fair average. "Colonry" liquor or briskness and pungency in cup was appreciated by dealers and blenders alike. Continental and American orders at times came in freely for nearly all descriptions of leafy Teas. Exports from here to other countries are growing, and bid fair to mark an increase on those of 1898 when made up. A firm Market ruled for Pekoe Souchong, and Pekoes up to 7 1/2d. per lb. in December, the quotation for useful Common sorts of the former especially gradually hardening, so that at the close very little could be purchased at 6 1/2d. per lb. Medium Pekoes and Orange Pekoes did not receive so much support from outside quarters, but were taken by London buyers at, on the whole, steady rates. Broken Pekoes met an irregular demand, though desirable lots under 8d. per lb. were usually in good request. Above that range, however, values were uncertain and sellers often had to accept a reduction on those previously current to effect sales. The higher grades were somewhat scarce, which no doubt detrimentally affected the average

October ...	8,750,000	6,500,000	6,000,000	6,750,000	5,400,000
November ...	6,500,000	6,500,000	6,500,000	7,500,000	5,500,000
December ...	11,000,000	8,500,000	8,500,000	7,500,000	8,500,000
	103,500,000	96,250,000	98,700,000	94,670,000	87,200,000

In reference to tea distribution from 1st January to 31st December, 1899, Messrs Forbes & Walker, Colombo, in their tea circular give the undermentioned figures.

	United Kingdom.	Russia.	Other countries in Europe.	America.
1899	104,699,248 lbs.	3,949,740 lbs.	885,051 lbs.	2,080,002 lbs.
1898	96,399,343 ,,	2,714,003 ,,	871 744 ,,	2,180,188 ,,

	Africa and Mauritius	Australia.	India.	China and Singapore.	Total.
1899	388,487 lbs	15,109,447 lbs.	567,616 lbs.	1,468,303 lbs.	120,147,891
1898	405,311 ,,	15,421,206 ,,	1,091,559 ,,	1,245,312 ,,	120,428 816

The following show an increase over 1898:—America, Belgium, China, Holland, Italy, Malta, Mauritius, Russia, Singapore, Sweden, and United Kingdom; while Australia, Austria, France, Germany, Spain, Turkey, India, and Africa show a decrease.

As regards the quantity of tea sold in Colombo the "Ceylon Observer" quoted recently the annexed figures for a series of years.

			lbs.		Average price, cents.

Adverting to the foregoing remarks regarding the "Tea Trade Dispute", your Committee feels that the action taken by the Ceylon and Indian Associations in London would have stood a better chance of being successful if they had arranged for combined action in Calcutta and in Colombo before embarking on a crusade against such a powerful body as the London Tea Dealers' Association.

TEA BLIGHTS.

During the first half of the year great attention was paid throughout the Planting Community to the then prevailing blights on Tea. Your Committee feels that, although great attention should still be given, and all blights and pests carefully watched, there is at present no need for extreme anxiety. It would appear that the effects of the various blights are largely minimized by high cultivation, and that there is good reason to believe that last year's climatic conditions were unfortunately favourable for the propagation and existence of Tea pests.

LONDON CHARGES OF TEA COMPANIES.

With reference to this important matter, your Committe thinks that the time has come to discuss and consider it. With a view to this end, the following extracts are submitted from an article in "The Investors' Review":—

"We propose to deal exclusively with the warehouse and dock charge upon tea, about which there is so much complaint, and, to start with, cannot do better than quote the schedule of rates supposed to apply to every package of tea that goes through the Tea Clearing House. This is as follows:—

CHARGES ON TEA.

To apply to all parcels by ships reporting on and after July 1st, 1888.

	Per package, weighing gross. 130 lb. to 150 lb.	90 lb. to 129 lb.	80 lb. to 89 lb.
	s. d.	s. d.	s. d.
Landing and housing rate	1 10	1 6	1 4
Management rate ...	2 3	1 10	1 1
Bulking and taring ...	1 8	1 5	1 3
Bulking, taring, or weighing net separately ...	1 3	1 0	0 11
Rent per week ...	0 0½	0 0½	0 0½

The above charges will be subject to a discount of 10 per cent. to importers only.

For determining the class under which the break is chargeable, the average gross weight must be ascertained. When the fraction of the average weight is half a pound or more, the dock companies or warehouse-keepers take the benefit. Thus, the average of a break being 79½ lb. gross, the whole break will be rated at 80-89 lb., but the average being less than 79½ lb., the whole break will be rated at 60-79 lb.

For the sake of bringing the table into manageable shape, we have deleted the rates upon certain exceptional sizes which are seldom used by importers. The general size of the packages is from 90 lb. to 129 lb., and in all calculations made in these articles we have taken the rates upon these weights as our basis, allowing the usual deduction of 21 lb., for the weight of the tare. The charges of most importance to the importer are "management rate"—*i.e.*, the working of the tea—"bulking and taring," and "rent." The management rate includes the landing and housing rate, and a large importer has defined the services rendered for this charge in the following terms:—

"Landing, wharfage, conveyance to warehouse, housing, sampling for importer and broker, sorting to marks and descriptions, weighing, examining for damage, laying down for broker's inspection, and attendance on broker, laying out in showroom for public sale, attendance while on show and sampling, adjusting to weights after sale, coopering, nailing down, trucking and piling for delivery, re-weighing and delivering to land conveyance. The rate also includes furnishing warrants and landing accounts."

Although this sounds formidable, an examination will prove that the greater portion of it represents work which is quite superficial. For instance, in "sampling for importer and broker" only one chest in a break is sampled, and when it is considered that a break consists more often of fifty chests than less, it is apparent that this entails no great amount of work. "Sorting to marks and descriptions" is for the convenience of the wharf in delivering. "Weighing" is only weighing the chest gross, as it arrives. "Examining for damage, laying down for broker's inspection, and attendance on broker, laying out in showroom for public sale, attendance while on show and sampling," are quite small items in dealing with a large number of chests. "Coopering and nailing down" applies to the sampled chests only, and although the rate includes furnishing the warrants, it does *not* include the warrant stamp (3d. per warrant).

"Bulking and taring" are rates that do not apply to every package. Teas are not infrequently bulked on the estate, and when this is done they are very rarely re-bulked. In regard to taring, according to the Customs regulations, a certain number of chests in every break must be tared from the gross weight of the package, in order to ascertain the amount of duty to be collected. Should there be a variation of more than a couple of pounds in the weight of the chest, nails, and lead—*i.e.*, the tare—each chest of the entire break must be tared, involving the heavy charge of 1s. per package throughout. In regard to "rent," all teas are sold on a "three months prompt," and rent is charged for these thirteen weeks, less five weeks, the rent for which is included in the "management rate." In most cases buyers take delivery of the tea within two or three weeks of the auction; but, however soon they may do this, the eight weeks' rent charged upon the tea, to make up the three months, has to be paid by the importer.

We have been at pains to explain the actual charges complained of by producers, and will now proceed to point out why they are considered onerous, but before doing so must first draw attention to the fact that the whole of the bonded tea warehouses in London are in a "ring." Treating the London and India Docks Joint Committee as one body, there are nineteen tea warehousing firms in the Tea Clearing House, which clearing house has a large number of subscribers, including all the principle buyers and Brokers in the trade. According to the rules of the Clearing House, no subscriber shall be entitled to warehouse or deposit tea with, or employ in connection with tea, any dock company or tea warehouse-keeper who is not a member of the Clearing House, or to purchase or sample any tea from the warehouse of any non-member." The "Ring," therefore, is most complete, for should a dissatisfied body of importers attempt to start a co-operative warehouse of their own, they find that they have the whole of the tea trade banded against them under the rules and regulations of the clearing house.

We shall have more to say about this matter later on. Returning to the subject of the charges, it is clear, both from internal and external evidence, that they are excessively high as consideration for the services rendered."

COCOA.

The estimate for the year 1899 was about 40,000 cwts. The amount actually shipped was 42,527 cwts., being the largest crop on record; probably 42,500 cwts. would again be a safe estimate. The agricultural position of the product may be summed up in the statement that owing to the ravages of canker, the red variety is being steadily superseded by Forastero. The various means of combating canker are well known, and the matter now remains with the Planters. It is a satisfactory point that since 1894 crops have steadily increased. As regards thefts of Cocoa, Government refused to consider any scheme of special legislation until existing means had been tried and proved a failure. A trial is now being given to the system of rural Police, under Ordinance No. 16 of 1865, and it is considered by some of those who have rural Police in their districts that the number of thefts has decreased, while others think that such Police have had no effect in checking crime. Your Committee would urge on Government the necessity of providing and removing the Police without going through all the formalities required by the Ordinance, as it is only during Crop time that their presence is required. The demand for Cocoa of inferior class has fluctuated considerably during the past year. Really fine Cocoas have been sought after, the demand for them continues, and prices for such are likely to go higher. The position of the London market, is on the whole, satisfactory, the supply has been larger than usual, but so has been the demand, the stocks are lower than they were a year ago. Your Committee annexes various tables and statistical returns as usual giving useful data regarding Cocoa.

COCOANUTS.

1899 has been on the whole a good average year as regards crop. Judging from exports, it has given a better total crop than any previous year, with the exception of 1898, which was a record one, but the increased acreage coming into bearing must be taken into consideration. The price of nuts has kept up well all through the year and the average price was quite as good as 1898 and better than previous year. The rainfall in the West Coast was some 20 inches less than in 1898, and this caused young nuts to drop off in the drought, so lessening the crop. This short rainfall may effect the crop in 1900, as coconnuts take a year to mature from blossom. For the total exports of coconnut products for 1899 as compared with previous years, reference should be made to appendix A and B of your Committee's Report.

CARDAMOMS.

During the past year the cultivation of Cardamoms, your Committee understands, has been largely extended both in Ceylon and in Southern India, particularly about North Travancore, where a large acreage of suitable land has been recently cleared and planted, while in Ceylon native gardens have been opened up in almost every village in the Central Province. It seems probable that the planting of this product may be ere long considerably overdone, and that prices may fall below a paying point. Compared with the year 1898, prices locally have already fallen some 20 to 25%, which, of course, affects the Home market. Exports to Bombay and Calcutta markets appear to have fallen off considerably. Possibly this is still due to Plague restrictions, but more probably the trade is being freely supplied from Southern India. The Chamber of Commerce Return shows exports in 1897, 532,830 lbs. in 1898, 531,473 lbs. and in 1899, 499,959 lbs. evidencing a decline in the past two years' crop, although cultivation has largely increased during the past two years. Whether this may be accounted for by the fact that on many of the older estates the crops this season have fallen off very considerably—some of them being as much as 50 to 60% short of estimates, probably due to a very wet season and blossoms not setting, is matter for observation.

RUBBER.

Your Committee has very little new information locally to report as regards this product, as it is difficult to obtain reliable data. The demand for seed still continues but mainly for export. The Director of the Royal Botanic Gardens, Peradeniya, has issued from time to time circulars giving details of experiments carried on under his instructions as to the best mode of cultivation and extracting the juice from the trees. As an appendix C, an interesting extract is given from the Report of the Secretary of Agriculture, United States of America, for the year ending June 30th, 1899, under the heading "India Rubber".

APPENDIX C.—EXTRACT FROM THE REPORT OF THE SECRETARY OF AGRICULTURE, UNITED STATES OF AMERICA, FOR THE YEAR ENDING JUNE 30TH, 1899.

INDIA RUBBER.

IMPORTANCE OF THE TRADE.

"The India-rubber trade is of great importance to the United States, and has shown a rapid increase during the last few years. For the fiscal year ended June 30th, 1890, the total importations of crude rubber amounted to 33,342,374 pounds, valued at $ 14,854,512, while that of manufactured rubber was valued at $ 367,647. In the fiscal year 1898 the imports of crude rubber and gutta-percha amounted to 46,055,497 pounds, valued at $ 25,386,010, while that of manufactured articles and waste or scrap rubber was 9,488,327 pounds, worth $ 805,951. This shows not only a decided increase in the quantity imported, but also a rapid rise in price. In 1890 about two-thirds of the entire amount imported came from Brazil. In 1898 about three-fifths came from that country.

A recent United States consular report shows that the importations into England for 1898 amounted to 20,026 tons, about half of this being Brazilian. New fine Para rubber was quoted at New York from 66 to 69 cents per pound in 1893, 69 to 71 cents per pound in 1894, 73 to 77 cents in 1895, 74 to 88 cents in 1896, 80 to 87 cents in 1897, and 82 to 83 cents January 1st, 1898. A single cargo of rubber, consisting of 1,167 tons, shipped from Para, February 23rd, 1898, was valued at $ 2,210,000 in United States gold. The exports of rubber from Brazil in 1898 amounted to $ 38,400,000 gold.

COLLECTION AND TREATMENT AND SOURCES OF SUPPLY.

Rubber is derived from the milky sap of a number of trees and shrubs, all native to the tropical regions of South America and the Old World. There are many plants with milky sap which contain small quantities of rubber, but none are known which produce it in commercial quantities anywhere outside of the tropics. The methods of collection and treatment of rubber are, in the main, very crude. There is a great deal of waste and considerable deterioration through improper methods of treatment in the field and in transit and through impurities. The only successful experiments at cultivating rubber plants which have thus far been made were undertaken by the English Government in Ceylon, India, and some of the other tropical colonies. By following the most improved methods of cultivation, and by giving the rubber plantations the same careful attention which is devoted to other crops, it appears possible to make this an exceedingly profitable investment.

The larger part of the Brazilian rubber is produced by the Para rubber tree, *Hevea brasiliensis*, which grows naturally in the deep shade of the swampy forests of the Amazon, where the air is fever-laden and the land is unsuited for human habitation. Experiments have been made with this tree in various of the British possessions in the East Indies, but without any marked degree of success, because the tree attains its full development only in the shade of dense tropical jungle lands, and not in the solid plantations. Its successful handling appears to lie in the direction of a proper system of forest management. The Central American rubber tree, *Castilloa elastica*, grows only in the dense tropical forests from Southern Mexico to Northern South America, on rich, well-drained bottom lands along the rivers. This tree has been found to grow luxuriantly under cultivation, but in the experiments thus far tried it develops a bark much thicker than in its native state, and this has been found a decided drawback to the successful drawing of the sap.

The Ceara rubber tree, *Manihot glaziovii*, is a native of one of the driest portions of Southern Brazil, where the mean temperature ranges from 77° to 86° F. There are now many plantations of it in India and Ceylon, and it is probable that this tree will be the first to produce an important addition to the natural supply of India rubber. there are 50 or more species of trees, vines, and shrubs which are a commercial source of India-rubber and gutta-percha, and the list is annually increasing. Experiments should be tried in the cultivation of every one of them. Gutta-percha is derived almost entirely from the tree *Isonandra gutta*, a native of the Islands of the Malayan Archipelago. The careless methods of the collectors have resulted in killing off most of the plants from which this substance is derived, so that a serious shortage has occurred during the last few years. The feasibility of cultivating this plant in the Philippines should be very carefully investigated."

TOTAL EXPORT FROM CEYLON DURING THE YEAR 1899.

Through the courtesy of the Hon'ble the Principal Collector of Customs your Committee places as an appendix hereto (A) statements of exports from Ceylon during the year 1899, and, as usual, submits also for purposes of comparison and reference the Returns for the same period drawn up by the Chamber of Commerce. (B.)

OFFICIAL ESTIMATE OF THE TEA CROP FOR THE YEAR 1900.

Your Committee estimates the Tea Crop for Export during the year 1900 at 138,000,000 lbs. As regards the distribution of the Crop the following is submitted:—"Russia 6,000,000 lbs; Australia 16,000,000 lbs; America 5,500,000 lbs; other countries 2,500,000 lbs. leaving, for the United Kingdom 108,000,000 lbs."

RAILWAY EXTENSION.

Members are aware that in General Meeting on the 17th February last year your Association endorsed its previous Resolutions on the question of Railway Extension Northwards and thereby reaffirmed your approval of His Excellency the Governor's policy as stated to the Legislative Council on the 5th November, 1897. His Excellency's policy is a policy of progress in reference to Railway Extension in Ceylon, and the particular Railways, the construction of which he proposed, are the Northern Railway; the Kelani Valley Railway; and the Uda Pussellawa Railway. By the courtesy and consideration of the Governor, your Committee is able to submit the following extracts from recent progress Reports by the Chief Resident Engineer as laid before His Excellency. In each case Mr. Oliver's report upon the work done is together with statement of expenditure as at the end of December, 1899. As regards the Northern Railway the plans showing the land required for this Railway have all been prepared, and all, with the exception of those for a distance of 11¼ miles near the Kala Oya, which is about 50 miles from Kurunegala, have been forwarded to Government for transmission to the Surveyor-General. At the Kala Oya a deviation of the original line has been proposed and surveyed with the object of placing the railway on ground freer from floods. Plans of this deviation have been sent to England for the Consulting Engineers to consider. A large number of pegs which marked the centre line of the railway have been destroyed, some by people in the neighbourhood, and some by decay, consequently most of the line has to be reset out. A length of 16 miles from Kurunegala, and half of the length of the line in the Jaffna Peninsular, have now been done. There are four Assistant Engineers engaged in the work. A contract has been entered into with some Singhalese contractors to build the combined upstairs Passengers' Station and Station Master's dwellings at Rangama Road, Balalla, Galgamawa, and Talawa. The work has been begun at Rangama Road. These buildings were excluded from the railway contract in order that they might be put up in hand before the works were let, so as to provide accomodation for the Engineers. A large quantity of material for this railway has arrived in the Island and has been, or is now being, stacked at Kurunegala. This material includes most of the iron work of the bridges and all the Permanent Way material, rails, fastenings and sleepers for the first twenty miles. Indents for the Permanent Way Material and iron works for bridges for another sixty miles, of which 40 miles are from Kankesanturai southwards) have been prepared and forwarded to England. The switches and crossings for Stations on the first twenty miles from Kurunegala northwards and twenty miles from Kankesanturai southwards have also been indented for. Mr. P. A. Mackintosh, owing to ill-health, left the Colony on November 23rd last, having previously handed over charge of this railway to me on the 6th November. As regards the Kelani Valley, railway all the plans of the land required for this railway have been prepared and sent to Government for transmission to the Surveyor-General. I have received the preliminary plans of the land as surveyed for the first ten miles out of Colombo. A deviation of the line at Kirilapane at 3 miles 10 chains has been made for the purpose of getting better foundations for the bridge over the canal at the place. The diviation shortens the length of the line by seven chains (154 yards), and the earth-work in consequence will be somewhat reduced. Another deviation of about a mile in length has been surveyed and will be marked out as soon as I have an Assistant to do the work between 33 and 34 miles. This deviation will cause a considerable reduction in the earth-work, and a bridge of 20 feet span to be dispensed with. The Permanent Way material, rails, fastenings and sleepers for 20 miles have been ordered, and contracts have been entered into to supply the rails and fastenings (in England) in January and February, and the sleepers, which are to come from Australia, in Colombo, in March and May. The iron work for the bridges on the first 20 miles and the whole of the rolling stock have been indented for. As regards the Uda Pussellawa Railway, I took charge of this railway on my arrival in the Colony in the beginning of October last, and in the early part of November two Assistant Engineers, Messrs Ross and Cartwright of the Northern Railway, were lent for the work of resetting out this line. The last survey of this railway was made in 1897, but the line was not marked on the ground, except on part of the line between Nanu Oya and Newera Eliya; on that survey also the length of straight line between reverse curves was, in a number of cases, insufficient. Mr. C. Craig, Chief Assistant Engineer, arrived in Ceylon early in November and took charge under me of the survey of the railway, having as assistants Messrs. Ross and Cartwright, above mentioned, and Messrs. Fowke and Dissaneyaka, private surveyors, engaged locally. The line is now properly marked out, and the plans

longitudinal and cross sections are prepared for a distance of 9½ miles, from Nanu Oya to Nowera Eliya, which is about one-third of the total length from Nanu Oya to Uda Pussellawa.

RAILWAY RATES.

The question of a Reduction of Railway Rates on Tea is still urgent and can in no sense be said to be settled satisfactorily to the concerned either in "outcast" Uva or elsewhere. His Excellency once remarked that the relief that would be most generally accepted would naturally be chosen. As a matter of fact, however, the reverse procedure was adopted in the concession so far granted, but as the Governor also observed that he did not wish to shut the door, it behoves your Association, your Committee, thinks to again agitate until the measure of relief sought for has been obtained. With a view to understanding the proposals under consideration, the following summary, drawn on behalf of the Railway, is recorded as showing the Estimated loss of Revenue involved :—

Reduction of the rate on Tea from 4th to 6th class	Rs. 252,571
Reduction of the rates per mile on the line above Nawalapitiya to the Main Line rates below Nawalapitiya on all traffic	309,286
Do. do. on tea, rice, and tea requisites only	210,907
Reduction of 50 per cent in the difference between the rates per mile above Nawalapitiya, and those charged on the Main Line below Nawalapitiya on all traffic	194,903
Do. do. on tea, rice, and tea requisites only	122,511
Reduction of the rate on rice for stations beyond Nanuoya only from 3rd to 4th class (a)...	67,691
Do. do. 3rd to 5th class (b)	87,565
Do. do. 3rd to 6th class (c)	129,094
Reduction of the rate on rice from 3rd to 4th class	407,146
Do, do. 4th to 5th class	113,215

(These calculations are based on the actual traffic conveyed over the Railway in 1897).

CEYLON GOVERNMENT RAILWAY.

A growing feeling of discontent in connection with the short delivery of goods on the Ceylon Government Railway, more particularly as regards Rice, led to the matter being brought before your Committee. A Sub-Committee was appointed to investigate the matter, and voluminous statistics were collected from Estate Agency Firms in Colombo showing that Rice was almost invariably delivered short. The papers showed that as much as 3½ per cent of shortage is a fairly common average in the case of Rice. As the correspondence chiefly dealt with shortages of Rice, the Sub-Committee confined [illegible] entirely to this matter. The great difficulty the Sub-Committee had to contend with, was that of finding out where exactly the alleged leakage took place, and before drafting the Report to your Committee, an invitation was sent to the General Manager of the Government Railway to meet the Sub-Committee in Kandy and to discuss the whole question in semi-private conference. It is matter for regret that this invitation was not availed of. The Sub-Committee thereafter drew up a short report which was submitted to your Committee, and after adoption forwarded to Government, to the Chamber of Commerce, and to the General Manager of the Railway. The Report briefly defined the situation and recommended certain alterations of the Rules and Regulations of the Railway which would tend to give greater security to the Consignee. The crux of the whole question at present is, that the Railway refuses to recognize its own weights as a basis for claim. This appears to your Committee a most undignified attitude for a Government Railway making enormous profits to suggest, and is also quite indefensible legally. The small pecuniary value of each particular short delivery in comparison with the waste of time and money involved in fighting a Government Department has no doubt deterred individuals or Firms from taking a test case, and has encouraged the Railway authorities in their uncompromising attitude. The margin of 58 lbs. per ton under which amount the Railway will not recognize any claim for freight over-charges, seems to your Committee to constitute a direct incentive to petty larceny. Incidentally the Sub-Committee could not fail to notice and to be impressed by other grievances connected with Railway transport and management such as leakage of wagons, careless weighment of Tea, inaccurate weighing machines at Stations, etc., etc. In fact, your Committee is of opinion that the time has arrived for a searching enquiry into the present management of the Railway.

MILITARY CONTRIBUTION TO THE IMPERIAL TREASURY.

In continuation of the paragraph in the Annual Report presented on the 17th February, 1899, your Committee deems it advisable to place on record for information and guidance the following statement by the War Office officially transmitted from Downing Street to the local Government on the subject of the cost of the Ceylon Garrison as defined by the Military Contribution Ordinance for the years 1895 to 1898.

	1895. £	1896. £	1897. £	1898. £
Cost of Garrison, omitting charges for new works	161,164	160,032	168,665	196,591
Three-quarters of above amounts	120,873	120,024	126,499	147,443
Military Contribution paid by the Colony for each year :— ...				
Expressed in Sterling ...	85,048	90,269	105,323	119,020
	Rs.	Rs.	Rs.	Rs.
Expressed in Rupees ...	1,540,499	1,611,943	1,763,066	1,684,934
Sterling value of Rupee during each financial year	1s. 1½d.	1s 1½d.	1s. 2½d	1s 3½d.

The War Office state that it will be observed that, while the growth of the Ceylon Revenue has, on the percentage system, caused the contribution to increase annually, the expense of the Garrison has also increased, with the result that the contribution still falls short of the maximum fixed by the Ordinance, viz., three-quarters of the cost of the Garrison.

The increase in expenditure is due to four principal causes :—(1) The gradual rise in the sterling value of the rupee from 1s. 1½d. to 1s. 4d; (2) an increase of the Garrison by seventy-four men; (3) special charges for new armaments; (4) the grant of messing allowance to European soldiers in 1898. The War Office add that there will be no objection to furnishing the Secretary of State for the Colonies with an annual statement of the military expenditure, and steps will be taken to supply it in November or December of each year, that being the time when the Army Appropriation Account is compiled and the information can be completed. It is estimated that the expenditure for 1899 will be about the same as for 1898, and that the contribution will be £122,035.

Total	£161,164	160,032	168,665	196,591

a Not included for 1898, messing allowance £4,918 having been issued locally, and included under vote 7.

b In 1898 there were special charges for new armaments about £15,811.

PROPOSED GRANT TO MEN OF THE CEYLON MOUNTED INFANTRY.

Your Committee desires to record an expression of regret at the present unfortunate position of this matter, and is of opinion that Government cannot be exonerated from responsibility as to the result, which is open to question, alike on grounds of policy and expediency. Considerable interest was evinced in the proposal which emanated from Government, and the fact that your Association was invited to move in the matter, gave reasonable hope that no fiasco would be allowed to occur. In last year's Report it was stated: Your Committee has not learnt whether Government approval has followed, and whether the proposed grant of Rs. 120 per annum will be shortly announced, but trusts that so much trouble having been taken in the matter effect will be given to the recommendation even as a tentative measure. On information being sought later in the year in reference to the proposed grant, your Committee was informed that His Excellency abandoned the proposal, on receipt of the letter from the Association in reply to the communication from Government on the subject, and that the Lieutenant-Governor was unable to go beyond the original suggestion, in the absence of any fresh facts. When it is remembered that ten years ago the then Major-General Commanding approached the Association on the subject of a Planters' Volunteer Corps, and that recognizing the importance of such a proposed organization the Committee did all in its power to make the movement known through the various District Associations, it would have been a graceful and gratifying acknowledgment had Government readily accepted the considered recommendation forwarded by the Association for the favourable approval of His Excellency the Governor, and granted the desired concession of Rs. 120 a year towards the upkeep of a horse to each man of the Mounted Infantry who attended Camp, made himself efficient, and at same time owned a suitable horse not less than 14 hands in height.

THE CEYLON CONTINGENT OF MOUNTED INFANTRY FOR SOUTH AFRICA.

Though not all Members of your Association, your Committee herein records the names of the Ceylon Contingent of Mounted Infantry for South Africa as a slight tribute to the pluck, gallantry, and devotion to Her Majesty's Person and Throne, which the speedy satisfactory enrolment of the Contingent exhibits. Your Committee and the Planting Community generally will follow the fortunes of each Member with keen interest, and meantime re-echoes the good wishes and enthusiastic send-off that have been so cordially bestowed on the "Absent-minded beggars" from Ceylon's most favoured Districts. The full list including the staff is as follows :—

TRANSVAAL WAR FUND FOR THE RELIEF OF THE WIDOWS AND ORPHANS OF SOLDIERS OF THE QUEEN KILLED IN SOUTH AFRICA.

A circular letter was forwarded to the Honorary Secretaries of all District Associations, and others, inviting their good offices in bringing the subscription lists, which accompanied, to the notice of members and others on behalf of the Transvaal War Fund for the relief of widows and orphans of soldiers of the Queen killed in South Africa. As duplicate lists appear also to have been circulated through other channels, it is not possible to state what the contribution to the Central Fund from the Planting Community aggregated, but according to the lists returned from the Honorary Secretaries of some of the District Associations over Rs. 6,000 was promised through these alone.

LABOUR SUPPLY.

PUBLIC WORKS.

What has been called the "New Policy" was definitely decided upon by the Secretary of State and communicated to the Government in despatch No. 222 dated 21st July, 1899. This despatch was considered at a General Meeting of your Association held on 5th December, 1899, and the resolution which will be found in the record of the proceedings was passed. The "New Policy" involves an expenditure of Rs. 20,641,000, half of which is to be raised by loan and half taken from surplus revenues of past and future years. The works to be undertaken are the Northern Railway from Kuranegalla to Jaffna and Kangesanturai on the light broad gauge estimated to cost Rs. 11,060,000. The Kelani Valley Railway from Colombo to Avisawella and Yatiyantota on the 2 ft. 6 in. gauge to cost Rs. 3,400,000 (since increased to Rs. 3,672,575·96) and the Udapussellawa Railway from Nanuoya to Rugala *via* Nowera Eliya, also on the 2 ft. 6 in. gauge, to cost Rs. 1,181,000. In addition to the above the "New Policy" includes the expenditure of a sum of approximately Five Million rupees on irrigation, to be spread over a period of some six or eight years, but of this sum Rs. 200,000 per annum may be taken from annual irrigation vote of that amount under Ordinance No. 6 of 1892. The surplus revenues accrued to the end of December, 1899, are expected to amount to at least Six Million rupees, and adding the Rs. 200,000 of the irrigation fund for eight years and the balance of the same fund unexpended which amounts to about Rs. 280,000 there would remain to be provided a sum of about Rs. 2,400,000, equal to Rs. 400,000 per annum for six years. The whole scheme came before the Legislative Council on the 13th December, 1899, and was unanimously approved of, though the Mercantile and Planting Members endeavoured to carry an amendment to the effect that it should be left to the Legislative Council to indicate how the funds for such purposes should be provided. In this, however, they were not supported by the other unofficial members. The estimates of expenditure for 1900 on Public Works annually recurrent amount to Rs. 2,011,200, a further increase on the amounts voted in previous years, and the estimates for Public Works extraordinary totalled Rs. 2,325,213, which amount was somewhat reduced by omission of the votes for new Public Works Department Offices and an extension of the Colombo Museum, as well as several other new buildings at outstations. It is noticeable that although several new roads have been applied for on the grant-in-aid principle they have nearly all had to be set aside owing to the very high cost of the work as estimated, which made it impossible for proprietors to accept the roads on those terms. Your Committee is of opinion that it should be optional for those interested to apply for a first, second, or third class road according to the requirements of the District, instead of being forced to accept any road that may be recommended by the Director of Public Works. If Government insist upon making first class roads when cheaper roads would be sufficient, they should bear the whole of the increased cost. At the request of the Mercantile and Planting Members a commission is to be appointed to inquire into the whole subject of the increased cost of Public Works in recent years.

EMPLOYMENT OF ESTATE COOLIES ON NEW RAILWAYS AND OTHER PUBLIC WORKS.

Considerable dissatisfaction has been felt at the apparent failure of Government to take adequate steps for the provision of labour for the new schemes of Railway construction. There is, your Committee finds, a widespread feeling of apprehension among the Planting Community that the prospect of comparatively higher wages might induce coolies to leave Estates for these works. It is also considered that likely sub-Contractors, especially in Planting Districts, might be tempted to offer high advances for Estate labour, which would tend to a general upsetting of the labour force all over the Island, and to militating against the work of the Labour Federation of Ceylon. This organization has already been instrumental in greatly reducing abnormally high advances, which, increasing by leaps and bounds during the past few years, had reached dimensions that threatened the stability of the Planting industry. A sub-Committee appointed recently to consider the question of Labour, drew up a memorandum which was adopted by your Committee and forwarded to Government. The memorandum suggested that Government should appoint a Labour Bureau, or Committee, which should include at least one member of the Planters' Association, and that Government should attempt to secure the co-operation of the Madras Government in recruiting Labour from Districts in India, other than those which at present supply the bulk of your Estate labour. The memorandum also pointed out the danger to the health of Tamil coolies employed on earth works in the low country, and suggested the employment of local Sinhalese, as far as possible, as such labourers are more inured to attacks of Malaria. Your Committee is fully aware of the extreme importance of pressing Government to take steps as soon as possible to provide labour for the new Railways and other Public Works which will necessitate the employment of large forces of local or imported labour. This course is more advisable than ever, as the departures during 1899 of Estate coolies from the Island have exceeded the arrivals. The question is a serious one, with possible grave results both to the Planting enterprise, to the Railway, and to the General Revenue.

KEEPING OUT THE PLAGUE: GOVERNMENT PROPOSALS TO PROTECT TAMIL COOLIES.

In May last your Committee forwarded the following Report to Government: "Your Committee having conferred with the Principal Civil Medical Officer and Inspector-General of Hospitals as instructed on the subject of the following resolution—' that, in drawing the attention of Government to the list of drugs and disinfectants stated as necessary by the Principal Civil Medical Officer for the requirements of each estate in the event of Plague, the Committee would urge that sufficient quantities be indented for, and kept in stock at the district dispensaries and hospitals for their own use and for the use of estates, as the Committee understands, from complaints received from various districts, that the dispensaries and hospitals are very inadequately stocked, the supplies being quite insufficient for what is necessary'—have pleasure in reporting that the drugs and disinfectants as stated as being necessary by the Principal Civil Medical Officer and Inspector General of Hospitals for the requirements of each estate, will be available in ample quantities at the district dispensaries and hospitals. With reference to the supplies of ordinary medicines at Government Dispensaries and hospitals, your Committee were informed by the Principal Civil Medical Officer that a Committee is now investigating the question of the supply and distribution of medical stores. Your Committee accordingly recommend that the Planters' Association should apply to Government for a copy of this report, which it is understood will be ready on an early date, and enable the Planters' Association to take further action if necessary. Your Committee learn with satisfaction that in the event of Plague breaking out on an estate, the Principal Civil Medical Officer's Department will take charge of the case and will provide attendants. Your Committee further understand that for the purpose of watchmen, the police have already been supplemented by enrolling their pensioners for special Plague duty. The matter is doubtless receiving consideration, but so far your Committee has not been favoured with the desired copy of the report of the Principal Civil medical Officer referred to on the question of the supply and distribution of medical stores."

RAGAMA CAMP.

Last year your Committee was able to report that four separate camps had been constructed. To these a fifth has been added and the camp is now considered to be complete. Each of the five separate camps consists of four or five sheds and are capable of accomodating about 500 coolies. There is also an Observation Shed for each camp, where suspicious cases of infectious disease can be isolated and watched. A good water supply is provided, also bathing and latrine arrangements and kitchens. There is one Infectious Disease Hospital for the whole of the camps. This is fully equipped, and there is a resident Medical Officer and Assistant. There are two incinerators for the five camps for the destruction of excremental matter and refuse. There is also a Threslis Steam Disinfecting Apparatus for the whole of the Camps, and cauldrons at each Camp for the boiling of infected clothing. One, and if possible two, Camps will always be kept empty to allow for an outbreak of plague. In order to accomplish this the arrivals of several consecutive days will be placed in one Camp, those of the next few days in another, and those of a third period in the third Camp. By the time the third Camp is full the immigrants in the first Camp will have passed a full ten days period of quarantine from the time they left their last place of infection, and that Camp will be ready to receive fresh arrivals, and so on in rotation. It is claimed that the institution of the one route of immigration *via* Colombo, combined with the Ragama Camp which has made it possible to close the North Road without too seriously affecting the influx of labour, has had a most beneficial effect in preventing disease of all kinds from attacking the immigrant cooly. Small-pox has been rather more prevalent than it should have been, but a new system has now been introduced of inspection at the breakwater which is likely to prevent this in future. The affected coolies are generally found to be unvaccinated. This has caused the Principal Civil Medical Officer to consider a plan by which the imigrants may be vaccinated immediately on arrival, and it is understood that this plan has been accepted by Government and will be carried out. It is matter for congratulation that the precautions adopted by the Plague Committee have been so far successful in preventing the outbreak of plague in the Island, and these precautions continue to be strictly enforced.

CEMETERIES ORDINANCE.

An Ordinance has been passed by the Legislative Council under the provisions of which the Government have power to make by-laws for the registration of burial grounds within specified areas, the limits of which shall be defined therein. Unless therefore by-laws are made specially including the planting districts within the limits defined, the ordinance will not be in force within those districts. During the debate on this Ordinance the Governor, at the request of the Planting Member, supported by the general European Member, stated that Government had no present intention of making such by-laws or of interfering with the customary method of burying the dead on estates. The Ordinance further provides that such by-laws, if made, have to be laid before the Legislative Council, when it is open to any member to move a resolution disapproving of them, and if such resolution be carried the by-laws will be disallowed. This Ordinance consolidates the law relating to General Cemeteries and Burial Grounds and will be of value in large towns and Municipalities, and it may even be advantageous to bring it into force in smaller towns and large bazaars, but so long as proper attention is paid to the burial of the dead on estates it will not be necessary to bring the Ordinance into force in the planting districts.

CRIME IN CEYLON.

A resolution on this grave subject was passed at a recent General Meeting of your Association, and was forwarded to Government, not certainly with the view to embarass those in authority in endeavouring to provide a remedy for the state of affairs disclosed judged from the information submitted, but so far as your Association is concerned, to strengthen the hands of His Excellency the Governor and his Executive Council. Your Association would dissociate itself from mere criticism or discussion as to the comparative prevalence of crimes of violence in different parts of the world, its sole object being by attracting notice to draw attention specially to the question of punishment. The deplorable state of crime in Ceylon, however, accounted for was certainly worse in 1886 than it now is bad as the record appears. Whether the time has not come to appoint a Commission of Enquiry for the purpose of considering means whereby crimes of violence may be more surely prevented is, your Committee feels, matter for consideration again. It will be remembered that in his address in opening the Legislative Council in 1886 His Excellency the then Governor remarked "I have been painfully impressed with the great prevalence of crimes of violence, and the comparative immunity with which they are committed. In 1885, and the first six months of 1886, one hundred and two distinct trials for murder, in some of which several persons were accused, took place in Ceylon. In only nineteen cases were capital convictions obtained. In addition to these cases twenty-nine murders were committed and reported by the police, for which no one has been even brought to trial; and large as this number would be if viewed relatively to the whole population, it must be remembered that with the exception of one or two, the whole of the murders have been committed by Sinhalese, and that the percentage of murderers must be taken from a population, not of nearly 3,000,000, but of less than 2,000,000. I offer no theory to explain these facts, but they are facts which call for very serious consideration." To these statements the Legislative Council replied :—"The Council share the deep concern felt by your Excellency at the prevalence of crimes of violence in Ceylon, and desire to express the earnest hope that some means may be devised for the better prevention, detection, and punishment of such crimes." Again, His Excellency, in opening the Legislative Council next Session, said—"When addressing you last year at the opening of the Session, I called your attention to the prevalence of unpunished, or inadequately punished, crime. I regret that I cannot perceive any improvement in this respect during the last twelve months. Crimes of violence continue to abound, and theft from dwelling houses has become so common an offence even in the capital as to create a general feeling of insecurity. My attention has been very seriously given to this most unsatisfactory condition of affairs, the causes of which are, I fear, complex, deep-seated, and of long duration. The evil is one with which it will be no easy task to grapple. To assist me in doing so I desire the co-operation of a strong Commission of Enquiry; but it is a matter of the utmost difficulty to find men competent to undertake such a duty, who have at the same time leisure to devote to it the time and close attention which its efficient discharge requires. In 1886, and the first six months of 1887, one hundred and forty persons were tried for murder, of whom 29 were sentenced to death. During the last three months there have been no fewer than 28 separate trials for murder, in which 43 persons were accused, of whom 9 were capitally convicted." Replying to these observations, the Council remarked—"Your Excellency's intention to appoint a Commission of Enquiry for the purpose of considering means whereby crimes of violence and thefts from dwelling-houses may be more surely prevented and punished meets with the cordial approval of the Council; and, while fully realizing the difficulties mentioned by Your Excellency, they yet hope that it may be possible to find among the several communities of the Island gentlemen with special fitness and qualifications, willing and able to serve upon the Commission." These somewhat lengthy quotations were made by your Committee at the time as a means of attracting notice to them, and because they unquestionably indicated a deplorable state of crime in Ceylon, however accounted for. It still appears to your Committee that a much more general use of the rattan as a means of punishment would be followed by satisfactory results, while whipping with the rattan is not open to the objections that may be raised in some quarters to lashes with the "Cat-o-nine tails."

PROVINCIAL AND DISTRICT ROAD COMMITTEES.

In your Committee's Report for the year ending 17th February, 1892, it was stated "Consideration has again been given to the proceedings of the Provincial and District Road Committees, and it is matter for regret that so far effect has not been given to your representations, though Government stated that they would have attention. Until the minutes of proceedings of the meetings are made public, as requested, it will not be possible to follow the decisions come to or to form a just opinion as to how far the provisions of the Ordinances are given effect to, and the interests of the tax-payers safeguarded. The commutation tax and the Ordinances enforcing it are so closely connected with the general good of Ceylon that your Committee feels that all sections of the community are deeply interested in the efficient and economical working of the laws on the subject. With a view to that cordial co-operation that is alike essential and advisable, your Committee would again urge Government to take the necessary steps in the matter without delay." It is satisfactory to report that after the lapse of years on a renewed representation being made a reply was received stating that in future the proceedings of the Provincial Road Committee, Central Province, and the District Road Committee, Kandy, would be forwarded to the newspapers for publication. There can be no doubt that this is a step in the right direction, because those interested instead of being kept in the dark have at all events now an opportunity of perusing the proceedings and of noting the progress of business in which they may be interested. Your Committee avails of the opportunity to strongly recommend every attention being given to the requirements of the law in relation to Local Committees, as their acts and decisions as well as their observations in regard to District roads and their requirements are of much value and assistance to the Provincial and District Road Committees.

EXCHANGE AND THE CURRENCY QUESTION.

In last year's Report it was remarked that it was impossible to foretell the ultimate result of the deliberations of Lord George Hamilton's Currency Committee, but your Committee is no longer in the dark, and has to record the following summary of the report to Parliament of the Indian Currency Committee.—"The Indian Currency Committee has made its report and recommend a gold standard with the sovereign as legal tender and fixing the rupee at sixteen-pence. The Currency report is divided into eight sections. The first section recounts the history of the Monetary System of India. Section two discusses the silver standard and says the re-opening of the Mints would be so fully and immediately discounted as to defeat the object of such a course. Discussing the fears of the Indian Tea Industry being threatened by China producing on a silver basis, the Committee consider that the permanent interests of the industry would be promoted if it was worked under the same standard of value as that of the countries to which they export their produce. The report concurs in the decision of Government not to revert to the silver standard. The third section argues in favour of a gold standard and says it is impossible to maintain the *status quo* permanently, though it might prove adequate to create a margin of gold sufficient to tide India over adverse years It advises that steps be taken to avoid all possibility of doubt as to the determination not to revert to the silver standard, and to proceed with measures for the effective establishment of a gold standard. The fourth section says the Committee is unable to commend the proposals of the Indian Government as embodied in its despatch of 3rd March, 1898. The fifth section deals with the scheme for establishing a gold standard without a gold currency. The Committee considers that the native habit of hoarding gold does not justify the permanent refusal to allow India a gold currency and favours making the British sovereign a legal tender. As to the current coin, it considers that the Indian Mints should coin gold unrestrictedly on the same terms as the Australian Mints. Section six of the Currency report, dealing with convertibility, says that the existing conditions prevent limiting the amount for which rupees should be legal tender, and for some time to come the Indian Government should not be legally bound to part with gold in exchange for rupees, but should make gold available for Foreign remittances whenever exchange falls below specie point. The exclusive right to the rupee coinage must remain vested in the Government, and profits should be kept in gold as special reserve. Section seven recommends a legal rate of six-pence for the rupee. The recommendation is not made unanimously, but by a majority of the Committee, who point out that this is now the normal rate to which prices may be assumed to have adjusted themselves. Section eight says, the effective establishment of a gold standard is of paramount importance to the material interests of India, not only to promote existing trade but to encourage the influx of capital. For the speedy attainment of this object it is eminently desirable that the Government of India should husband its resources and exercise resolute economy to restrict the growth of gold obligation.

DISCOUNTING OF PROMISSORY NOTES DRAWN UPON ESTATE KANGANIES BY THE LOCAL BANKS.

A letter was issued to all Banks in Ceylon pointing out that the custom of discounting Kanganies' notes is greatly prejudical to the interests of the Planting Community and tends to increase coast advances which the Association is most anxious to check, and that facility so granted encourage fraudulent transactions. Your Committee urged all Managers of Banks in Ceylon as far as possible to discontinue the custom. From the replies received your Committee thinks that the practice will be discouraged as far as practicable but continues to give prominence to the matter.

JURY LISTS, CENTRAL PROVINCE.

Early in the year your Committee drew the attention of Government to the Jury Lists of the Central Province published in the Government Gazette as being most defective, and pointed out that the Resolution of the Committee forwarded to Government on the 26th March, 1898, recommending extension of radius of those liable to serve was accepted by Government and should be adhered to, the entire lists being thoroughly

revised. In reply Government stated that inaccuracies referred to would be corrected when the list was revised in January, 1900. Your Committee trusts that the lists of Jurors and Assessors under the provisions of the Ordinance of 1896 No. 15 section 257 Criminal Procedure Code recently published will prove to be more correct than previously and would invite the co-operation of all Planters in still further improving the said lists.

Theft of Prædial Products.

A considerable amount of attention was given by your Committee to this subject, and it is hoped that some success has followed, in any case the question will by no means be lost sight of.

Nomination of Visitors to Hospitals and Dispensaries in the Planting Districts.

As indicated in last year's report a very considerable amount of trouble was taken in connection with lists forwarded by Government of the Visitors of Hospitals and Dispensaries in the planting districts with a view to revision and correction if necessary, and it is to be regretted therefore that notwithstanding, the matter cannot be said to have been materially advanced. All nominations submitted to Government, are of course, for approval while it has been usual for Government to give effect to the wishes of the Planting Community on the subject as notified by the Planters' Association. As it was found quite impracticable to revise the lists most recently received from Government, it was resolved that the Secretary be asked to continue the correspondence with a view to obtaining a correct list of visitors actually serving in the various districts, and whose appointments have been approved by Government. To this end a letter has been addressed to the Honorary Secretaries of each District Associations asking for the names of the visitors actually serving at date in each district with a view to co-operating in bringing the matter into order in so far as the lists are concerned.

Reduction of the British Tea duty.

Your Committee, in continuation of the paragraph under the above heading in the Report for last year, has now to add that this important question, at the instance of the Indian Tea Association (Calcutta), was again considered by your Committee on more than one occasion, and was eventually referred to a General Meeting of your Association for disposal. After a long and interesting discussion, it was deemed undesirable to take action in the matter at present. Your Association is thus free to re-open the question at any time should circumstances be more propitious, and the interests of the Tea Industry appear to call for such action in the future.

Reduction of Telegram Charges between the United Kingdom and the East.

During the year your Committee has watched with interest Mr. J. Henniker Heaton's action in reference to the reduction of Telegram charges between the United Kingdom and the East, and intimated to him that the Association would readily and cordially co-operate with him in his efforts to reduce the charges complained of, while your Committee has supported various Chambers of Commerce in the steps taken to a like end. In this connection it is interesting to note what recently fell from Mr. E. A. Sassoon, M. P., when reading a paper on "Imperial Telegraphic Communication" before the Liverpool Chamber of Commerce. He said on behalf of the House of Commons Imperial Telegraph Committee he thanked them for their presence, which might be regarded as a protest against one of the most gigantic impositions to which, perhaps, any civilized community had yet to submit.....For a great many years past the burden of the excessive charges exacted for Imperial Telegraphic Communication had been felt by all the constituent portions of the Empire.....The Chancellor of the Exchequer expressed himself as being in absolute agreement with them and admitted "that, at any rate with regard to India, there is a very considerable grievance in the cost of Telegraphic Communication, and, whether the matter had better be approached in the first instance by Royal Commission or by a Committee of the House of Commons, or whether it is possible by the action of the departments principally concerned. In the Post Office and the Indian Government, or by some such process as Sir Edward Sassoon has suggested of filling up gaps between different systems, a good deal might be done to improve the position.....The rates of the Companies, though they were reasonable when the enterprise was in its infancy, were now, in view of the phenomenal increase of traffic, wholly antiquated and intolerable; and as to codifying, all the contrivances of codes and condensation had now reached their high mark of perfection, therefore no relief in that direction could be looked for.....With the awakening of the constituent elements of the Empire to the necessity of drawing closer together to the Mother Country, a demand had arisen for facilities for the transmission of messages of a social character; that demand was irrepressible, and it was also one which no Government could wish or afford to neglect,.....All they asked for was fair play and bare justice. The fates were propitious, the auguries encouraging, and with their intelligent sympathy, and with their earnest, strennous, and unfaltering support they should before long record a great and a beneficent triumph...."...In the result it was recommended that support should be given to the action which the Imperial Telegraph Committee of the House of Commons propose to take with the view of placing the important matter of electrical communication between the United Kingdom, India, and the British Colonies and dependencies on a footing commensurate with the greatly altered conditions of Imperial and Colonial relations

Agricultural Department.

In the Annual Report a year ago your Committee urged the importance of the inauguration of a Government Agricultural Department, being of opinion that such department should have for its purposes the advancement of all cultivation, agricultural and horticultural in the Island, also the improvement of stock. In support of the views entertained it is submitted that existing products require to be kept in as good a state of health and productivity as possible, by continually studying the best methods of cultivation, and by enabling all to benefit by the information thus gained. Further, that the *improvement* of varieties at present cultivated by hybridisation, grafting, approved methods, and the introduction from other Countries of new varieties, which may succeed better than those already grown, are desiderated. As a proof of this it is instanced how much had been done in the improvement of Cinchona in Java, owing to scientific advice. The necessity of watching the enemies of each cultivation and of investigating methods for combating these, so as to prevent the spread of diseases, and to minimise their evil effects is apparent while enquiries regarding various soils, their analyses and the analyses of manures, also the chemical investigation of the changes which take place in the curing of products, such as Tea, Cocoa, Cardamoms and the like, with a view to the discovery of the methods producing the best Commercial results, and the testing of the vitality and purity of seeds to be used in planting, are of the highest practical importance. In order to carry out these duties, your Committee urged the appointment of an Entomologist, a Mycologist, and an Agricultural Chemist, and your Committee is glad to report that His Excellency the Governor, fully realizing the duty of protecting the Agricultural Industries of Ceylon, selected a Mycologist, in addition to the Entomologist already appointed. His Excellency has further been asked by your Committee to add to the scientific staff by nominating Mr. M. Kelway Bamber as Agricultural Chemist—a step than which none would give greater satisfaction generally. The growing interest in scientific cultivation is most apparent, and your Committee feels confident that much benefit will accrue to both European and Native cultivation by the early establishment of an Agricultural Department.

Dharma Lines or Coolie Sheds Erected by Subscriptions collected under the auspices of the Planters' Association of Ceylon in 1855.

In January, 1899, a letter was received from the Government Agent of the Central Province inquiring whether the Planters' Association had any objection to the appropriation of the Dharma lines in the neighbourhood of the Railway Terminus with a view to the premises being utilized as a House of Shelter within the Municipality of Kandy for the large number of destitute people who are found sleeping in open verandahs and other similar places. The reason given for approaching your Association in the matter was clearly stated to be because a moiety of the cost of the buildings has been paid by the Planters. In reply, your Committee stated that the Planters' Association had no objection to the proposed appropriation of the particular buildings referred to, but desired to be authoritatively informed whether in a similar manner a moiety of the cost of the Dharma lines situated on the Katugastota Road a little more than a mile from Kandy had not been paid for by the Planters. The Government Agent at once acknowledged with thanks the communication, and intimated that the other Dharma lines referred to were built by a similar arrangement. The matter having been considered by your Committee the following Resolution was passed on the subject and was forwarded to the Government Agent:—"That, as it is understood that the buildings are at present used in connection with the Civil Medical Department, Government be asked to a refund the moiety of the cost and/or rent to the Planters' Association since date of occupation, and to state why the said Dharma lines were so appropriated without reference to the Planters' Association as has been properly done in the case of the similar lines near the Railway Station." A bare acknowledgment only was received; but it having transpired that the Hon'ble Mr. Allanson Bailey had represented to Government that he did not see what claims the Planters' Association had to refund of a moiety of the Cost or to Rent on the ground that the moiety was not contributed by the Association, alleging that it was not in existence in 1856, your Committee deemed it proper to approach His Excellency the Governor. This was done by submitting a letter which had been addressed to the Colonial Surgeon, Central Province, as giving briefly a few indisputable facts and reasons why the Planters' Association was clearly entitled to claim a refund on sale or alienation of the premises. Your Committee regrets to say that the acknowledgment of this representation was unsatisfactory, it being indicated that the request could not be entertained. In reply to a further communication enquiring on what grounds the reasonable request conveyed could not be entertained, it was merely mentioned that as the money was devoted to the purpose for which it was intended, and was handed over to Government, the question of its refund could not be entertained, adding that when the building was no longer required for the particular purpose for which it was erected, it was converted at considerable cost to another useful purpose in the public interests, but that this gives the Planters' Association no right to ask for rent or a refund. In the opinion of your Committee such rejoinder carries its own refutation. When it was proposed to utilize a similar building for a purpose more or less analogous with the particular object for which it was originally erected, Government *ex mero motu* asked the Planters' Association for its consent to such appropriation, but when the Planters' Association properly points out that similar premises, built, according to Government, under the same conditions had been alienated without reference, agreement, or compensation, and invites some reasonable adjustment of accounts between Government and the Planters' Association as the acknowledged representatives of the subscribers in question, no gracious bearing is granted, but even a right to ask for an accounting is denied. So as to demonstrate and reiterate the right of your Association to consideration, especially in view of the intended disposal of whatever sum may be due, your Committee deems it proper and likely to be useful for reference in the settlement of the question to annex hereto extracts of the proceedings of your Association as authoritatively showing how the funds to erect the building were obtained, and that the least Government ought to do on appropriating the bricks and mortar for another purpose not contemplated, nor agreed to by the Association on behalf of the subscribers, is to refund the moiety contributed, or such sum of money as may be agreed upon on taking over the Dharma Lines or Coolie sheds alluded to. It should be added that, as representing the original subscribers and on its own behalf, the Planters' Association does not propose to use the money that would thus be available, on being repaid by Government, for ordinary expenditure, but to re-invest it in bricks and mortar for a semi-public purpose, namely in handing it over as a contribution to the cost of the foundations of the Victoria Commemoration Buildings at Kandy, which owing to the nature of the site, has reached a very much larger sum than was contemplated or could not have been foreseen when the particular scheme was undertaken. The following are the Resolutions, &c., referred to above. Extract of Minutes of Proceedings at the Annual General Meetings of the Planters' Association held at Kandy on the 17th February, 1855. Resolved:—"That in view of the satisfactory state of the funds of the Association, a sum of one hundred pounds be given towards the erection of a cooly shed at Kandy." Extract of Minutes of Proceedings of a Committee Meeting of the Planters' Association held at Kandy on 18th August, 1855. "Read a letter from the Government Agent requesting the deposit of the Public Subscription of £300 on account of new Cooly Shed, together with a letter from the Chairman in reply. The Secretary informed the Committee the money had been paid on the 6th instant; and read Government Agent's letter acknowledging receipt. Extract of Minutes of Proceedings of a Committee Meeting of the Planters' Association held in Kandy on 22nd September, 1855. Resolved:—"That the Secretary be requested to call a General Meeting of the subscribers to the fund for providing shelter for travelling coolies, to decide on the appropriation of any balance that may remain after building the Kandy Cooly shed, and that the Meeting be held on the day of the next Committee Meeting, and further, that a subscription paper be sent round to the various members of the Planting Community, whose Estates may be so situated as to make Gampola a point through which their coolies would in all probability pass, inviting them to subscribe to the erection of a shed there, provided that no objection be raised to such appropriation at the General Meeting. Extract of Proceedings of a Committee Meeting of the Planters' Association held in Kandy on January 19th, 1856. "Read a letter from the Acting Commissioner of Roads requesting to be informed whether the subscribers to the coolie sheds would wish the building to be erected by contract or by his department. Resolved:—"That the Secretary be instructed to reply that the Committee are of opinion it would be desirable that the buildings should be erected by the Commissioner of Roads, as the subscribers will then have the assurance that the work will be efficiently executed." Extract of Annual Report of the Planters' Association for the year ending 17th February, 1856. "A year ago a subscription was set on foot for the purpose of erecting one or more Sheds in Kandy, and a sum of £315 was subscribed for that purpose. To this the Association made a grant of £100, the Government contributing a further sum of £300, making altogether £715. It is estimated that a couple of sheds large enough to hold all the coolies that may require to be in Kandy at one time, may be erected for £600, leaving a surplus of £115, which it has been decided to appropriate towards building a shed at Gampola, where one is much needed, and to which the Government will contribute £100. Some little difficulty has been experienced with regard to one of the sheds in Kandy—in consequence of the ground in the vicinity of the lower lake, where it was judged desirable to place it being claimed by the Military authorities. Your Committee, however, have reason to hope that this difficulty will shortly be removed, and that the work will shortly be executed without further delay. A second shed is now in course of erection at Mahayawa, between the end of Trincomalee Street and Katugastota Ferry, which, when completed, will be of great service to the coolies." Your Committee recommends that a copy of this paragraph be transmitted to His Excellency the Governor in continuation of previous correspondence and for his judicial and equitable instructions in the matter.

Planters' Wards at the General Hospital, Colombo, and at the Baker Ward, Nuwara Eliya.

As usual, your Committee begs to submit a return showing the number of planters who availed themselves of the Planters' Ward at the General Hospital, Colombo, during the year 1899, furnished by the courtesy of the Principal Civil Medical Officer and Inspector General of Hospitals.

Number remaining on 31st December, 1898 ...	5
Number admitted during 1899 ...	50
Total	55
Number discharged	51
Number died	1
Number remaining on 31st December, 1899 ...	3

As regards the Baker Ward, Nuwara Eliya, 3 planters were admitted, and one died therein.

Ceylon Tea Kiosk.

In pursuance of His Excellency's decision as notified in last Annual Report of your Association, and with reference to further correspondence, the Planting Member in Council was empowered, having regard to the Governor's expressed preference in the matter, to arrange for the removal of the Tea Kiosk to the lower site with the same privileges as before on condition (1) that the new building be at least of equal capital value and as spacious as the old one; (2) that the new kiosk be erected before the old kiosk be dismantled. During the year an overture was made through the lessees of the property affecting the decision previously arrived at by the Planters' Association on this important matter, but your Committee declined the proposal and confirmed the action already desired and determined by your Association. The definite arrangements authorized having been thus confirmed and settled on the lines agreed upon with Government, your Committee desires, in again recording your appreciation of His Excellency's attitude in the matter to quote here for future reference and guidance the following sentences from "Hansard" as summing up the position of the question at date. During the consideration of the Supply Bill in Committee of the Legislative Council in December, the Hon'ble the Low Country Sinhalese Member "asked permission to return to the 'New Works and Buildings,' and said he would like to have some information regarding the item of Rs. 15,000 for the cost of building the Tea Kiosk. He would like to know whether it meant that Government undertook to put up another building at that cost or whether the money was to be given up to the persons who put up the building for them. His Excellency the Governor:—For this vote of Rs. 15,000 I am personally responsible, and I think it requires an explanation. My predecessor gave the site for the Tea Kiosk to the Planters' Association and promised that it should not be removed unless it was absolutely necessary. Absolutely necessary is very difficult to define, but in order to avoid anything that might give a pretext for a charge of breach of faith against the Government, you know how easily these charges are made and the levity with which they are made, I thought it better to stretch a point as to whether the absolute necessity did exist, and to grant a vote of Rs. 15,000 to the Planters' Association to enable the Tea Kiosk to be removed to a more convenient site. We cannot compel them to do so, but it certainly would be a great concession to the public if they do. That is how the matter stands. The Hon'ble the Low Country Sinhalese Member:—Does this mean that the Government intend to provide a site as well? His Excellency the Governor:—Certainly, according to the reading of the engagement the Government are to put the Kiosk and the Planters' Association exactly in the same position as if the Kiosk had not been removed."

Criminal Procedure Code—Instructions for the Use of Justices of the Peace and Unofficial Police Magistrates.

The appended Resolution having again been forwarded to Government a reply has been received stating quite lately that the Attorney General, who has been asked to prepare the necessary instructions, reports that the matter is receiving his attention. The words of the Resolution were as follows—"That the attention of Government be drawn to the second paragraph of letter dated 2nd December, 1897, in which it is stated, in reply to the Resolution, 'that Government be asked to issue a memorandum defining and explaining the powers and duties of Justices of Peace and Unofficial Police Magistrates,' that it was considered desirable to await the amendment of the Criminal Procedure Code before issuing such a guide as had been suggested for the use of Unofficial Police Magistrates, and, with reference thereto, to enquire when it is proposed to issue the Guide Book."

Analysis of Manure: Draft Ordinance for Regulating the Sale of Manure.

Adverting to the paragraph on this subject in last year's report, your Committee is extremely disappointed that, though the matter has continued to engage attention and correspondence has passed between the Chamber of Commerce and your Association, the result at date is unsatisfactory, inasmuch as another Session of the Legislative Council has practically passed without Government having been approached on the subject of the legislation desired and determined by both representative bodies for a number of years.

Analysis of Samples of Cocoa.

On the recommendation of the Cocoa Committee of the Planters' Association an analyses of nine samples of Cocoa of the principal brands sold in London were submitted to Mr. John Hughes, F. C. S. for analysed, with a view to ascertaining if any adulteration exists which might prejudice the interests of Cocoa Planters. Your Committee has made public the results of Mr. Hughes' analyses and your Association paid the cost thereof amounting to Rs. 202.

Fire Insurance Rates.

This matter has received a good deal of consideration from your Committee, who adopted a Report by the Sub-Committee of the Committee of the Planters' Association of Ceylon appointed to collect information on the subject of Fire Insurance Rates. Your Committee considers tha the rates charged bear an undue proportion to the risks incurred, and a copy of the Report and Resolution were forwarded to the Secretary of the Ceylon Fire Insurance Association with a request that the matter should be submitted to the Fire Offices in London. A reply has now been received from the Secretary, Fire Offices Committee (foreign), to the Secretary of the Ceylon Fire Insurance Association expressing regret that no reduction in the rates can be made and pointing out that the rates for Tea Factories have lately been reduced. The decision of the Fire Offices Committee (foreign) has not yet been discussed by the Ceylon Fire Insurance Association but it will be considered shortly.

Criminal Breach of Trust by Servants in this Colony.

During the year the Chamber of Commerce endeavoured to have the question of extending the provisions of Ordinance No. 22 of 1889 (An Ordinance relating to Criminal Breach of Trust by Public Servants in this Colony) to private employees, and the matter was brought before your Committee who passed the following Resolution—"That it is desirable to extend the application of the provisions of Ordinance No. 22 of 1889 (relating to Criminal Breach of Trust) to others than public servants with such modification or alteration as may seem necessary to Government, and that a copy of this Resolution be forwarded to Government with a request that it may receive their favourable consideration." Government, however, having refused to extend the Provisions of the said Ordinance it is not proposed to take any steps further on the question at present.

Ceylon Association in London.

During the year the question of how the Ceylon Association in London originated was discussed both in London and in Ceylon, and the relations and position of the respective institutions were subject of comment. The matter may be said still to be under consideration, as the reply from the Ceylon Association in London to your representations has not been laid before the Committee until to-day, it having been only recently received. The communication has been published meantime; and will doubtless have careful attention from your Committee in the new year. Your usual Annual contribution of £60 sterling for the year 1899 has been paid, and whatever may be the result of a further interchange of views, your Committee would repeat the words used last year as to the maintenance of a good understanding and express the hope that cordial co-operation will not be impaired by past events, but that greater efforts will be made to keep in close touch as regards all matters having for their object continued agricultural prosperity and the general good of Ceylon.

Victoria Commemoration Buildings Scheme.

(*Monument of the Reign of Her Majesty Queen Victoria.*)

Though by no means complete, your Committee decided at a recent meeting to invite His Excellency the Governor to formally declare the Victoria Commemoration Buildings open on the 17th February, 1900, and in the sixty-second year of the reign of Her Majesty. The regret will be general that His Excellency is unable to be present, as he is on tour and his plans were made. It is understood, however, that at a later date he would make an effort to attend some other function in connection with the Victoria Commemoration Buildings Scheme. Members will no doubt recollect that the site on which the buildings have been erected has been granted and assigned by the Crown to your Trustees in free and common socage for ever subject to the following conditions and provisions:—(1) that the land be used for the erection of buildings to be called the "Victoria Commemoration Buildings", in accordance with the plan approved by the Governor of Ceylon and annexed to the grant; (II) that the Buildings be kept up and maintained as (a) a Monument of the Reign of Her Majesty Queen Victoria, (b) a Hall therein as a Memorial to the late Alstair Mackenzie Ferguson, C.M.G.; (c) a Tower thereon as a Memorial of the late George Wall; (d) the place in which the meetings of the Planters' Association of Ceylon are to be held when such are called in Kandy; and for such further and other purposes as may from time to time be allowed. The amount of money collected and paid over to the Treasurer to the subscribers aggregates Rs. 43,219·73, while the disbursements so far amount to Rs. 38,719·94. Members are referred to paragraphs appearing in the Annual Report for the years ending 17th February, 1898, and 17th February, 1899, for further concise information and details and from which it will be plain that before the undertaking can be said to be accomplished further efforts will be needed, and will doubtless be supported as may be hereafter recommended. Meantime your Committee proposes to vote Rs. 1,000 this year towards the cost of the foundations, which, as already stated, have entailed an unavoidable expenditure of large amounts in excess of estimates. Your Committee would only add that the opening ceremony must be gratifying to Mr. Hugh Blacklaw as Honorary Secretary to the Committee who first collected the subscriptions that have enabled the "Ferguson Hall" to be erected and thus to perpetuate the memory of one who, through his long public life, did so much to advance the material, moral, and social condition of the inhabitants of Ceylon during the reign of Her Majesty the Queen.

Planters' Benevolent Fund.

Established to Commemorate the Jubilee of Her Majesty Queen Victoria, 1837-1887.

The Planters' Benevolent Fund, your Committee is glad to report, has maintained its position, as the accounts for the year ending 31st December, 1899, show that the sum of Rs. 4,566·87 has been collected by the Honorary Treasurer during the past year. Your Committee understands that several applications for assistance were received, but most of them were of such informal character that they failed to come within the scope of the Regulations; the principal grant made, however, would, in the opinion of your Committee, of itself fully demonstrate the value of the organization and the importance of steady support and generous monetary donations. One or two wealthy Proprietors, who made money in Ceylon, have lately passed away, and it can hardly be doubted that, had the Fund been prominently brought under their notice, that a bequest or legacy to the "Planters' Benevolent Fund" would not have been overlooked. Your Committee again appeals to all Planters of Ceylon as well as to the Subscribers to pay either by Donation or Annual Subscription towards rendering the Fund not only permanent but capable of extended usefulness and beneficence. When settling affairs, as all must do, Proprietors should remember a legacy to the Fund.

George Wall Reference Library and Tower.

The usual additions have been made to the Reference Library by the courtesy of Government and kindred Institutions to whom your thanks are thus publicly tendered. Much remains to be done, but in the new domicile, beneath the George Wall Tower now completed and erected to keep in remembrance the founder of your Association nearly half a century ago, it is hoped that gradually a useful and valuable collection of Books of Reference and of other data desiderated will be available. In this connection, and in view of the ceremonial inauguration to-day, it is interesting to recall that Mr. George Wall was present at the Public Meeting held at Kandy on the 17th February, 1854, for the purpose of organizing a Planters' Association, and it is at least matter of tradition in the present generation that he was the moving spirit in its establishment during these early days of the Planting enterprise and years before the Railway to Kandy from Colombo was constructed or even roads had been made into the Planting Districts. Mr. George Wall was elected along with others to act for the first year as a member of Committee with Captain Jolly and Mr. A. Brown ex-officio as Chairman and Secretary respectively, while on the 17th of February, 1885, by an unanimous and cordial vote the honour of the Honorary membership of your Association was conferred on Mr. Wall whose services to your Association and the Planting Community had been alike unique and invaluable. On only two other gentlemen has this honour been conferred namely, the late Robert Boyd Tytler and G. H. K. Thwaites, C.M.G

Portraits of Chairmen, Representatives in the Legislative Council, and Secretaries of the Planters' Association of Ceylon.

One of the members of your Committee has, with characteristic enthusiasm, been instrumental in carrying to a successful issue his scheme, which had your approval, for obtaining portraits of Chairmen, Representatives in the Legislative Council, and Secretaries of your Association to be placed in one of the rooms of the Victoria Commemoration Buildings. Your thanks are due to Mr. Westland for much time and trouble kindly taken in connection with the collection which, it is hoped, will shortly be completed as desired and determined.

District Associations.

At the conclusion of another year your Committee has much pleasure in placing on record an expression of appreciation and thanks in connection with the labours of the office-bearers of the twenty affiliated District Associations. Without the cordial co-operation accorded the continued success of your Association from various standpoints would not be so manifest, and it is but right that mention thereof should be made herein. Your Committee has been informed of the formation of a District Association for Rangalla, but so far it has not been affiliated, while your Committee would again recommend to those directly interested the re-organization of a District Association for Kotmalie and the neighbourhood of Nawalapitiya. Only gain can result by the public spirit necessary in such matters and the advantages of well directed efforts for the welfare of the Community cannot be doubted apart from the benefits that always follow united action on questions relating to the general good.

Representative in the Legislative Council.

Your Committee begs to render to the Hon'ble Mr. J. N. Campbell your hearty acknowledgment and thanks for his able and valuable services as your Representative in the Legislative Council of Ceylon. As already indicated, your Committee believes that much good has accrued to the Planting Community by the representation thus afforded, and desires herein to support the action of your Representative on questions of General Policy Railway Extensions, and other matters lately under consideration, and to assure him of the confidence of your Association.

Trimen Memorial Brass.

Your Committee has to report that, finding exception taken to the location of the Trimen Memorial Brass, in consultation with the Director of the Royal Botanic Gardens and by his courtesy it has now been placed on the wall of the Museum Buildings at Peradeniya.

Obituary.

With every mark of regret and respect your Committee has to add to the Death Roll the following names of members of the Planting Community who have departed this life:—James Bisset; Philip Anstruther; Charles Tottenham; Charles Ogilvie; P. E. T. Rogers; F. C. Woods; A. Scott Blacklaw; Donald Reid; Donald Cameron; C. M. McCausland; A. C. Campbell; C. H. Morris; A. J. Pomeroy; Jas Stephens; A. C. White; Alexander Ross; R. V. Millington; A. D. Souter; J. Nutcombe Gould; John A. Rossiter; Alexander Maitland; John Walker; F. Drummond; T. C. Anderson.

Finances.

The usual statement of accounts is laid on the table and shows a credit balance of Rs. 1,830·16.

Mr. Philip having been suddenly ordered Home on peremptory Medical advice, after arranging as far as possible for the Meeting of Committee held a few days later, left Ceylon on the 8th July and returned on the 12th November, 1899. He was also able to attend to and to complete as usual the compilation of the Book of Proceedings for the year ending 17th February, 1899, taking with him all necessary papers for the purpose, while Mr. W. D. Gibbon kindly acted as Secretary during Mr. Philip's short absence.

Though from a local standpoint perhaps there is not much to add by way of general remarks, the year has been especially eventful owing to the state of War that broke out between the Transvaal and Orange Free State and Her Majesty's Government by reason of the ill-advised and reckless Ultimatum transmitted from Pretoria in October, 1899, and which act will ever remain matter of History throughout the whole world. Abundant proof, if such were needed, has been evoked at Home and abroad of the loyalty and patriotism that, as a late poet wrote, "surrounds your 'revered, beloved,' Queen Empress, Victoria, who has ever wrought her people lasting good, and by her Statesmen known the seasons when to take occasion by the hand and make the bounds of freedom wider yet." At present, your Committee feels that no more appropriate words can be used in closing your Association's year than "God save the Queen."

REPORT OF THE THIRTY COMMITTEE.

Report of the "Thirty Committee" appointed to administer the proceeds of the Export Duty on Tea, levied under Ordinance No. 4 of 1894 for increasing the consumption of Ceylon Tea in foreign lands for the year 1899.

Members of the "Thirty Committee," 1899.

The following is a list of the "Thirty Committee" at 31st December, 1899.

Messrs. James Westland, J. A. Burmester, A. C. Kingsford, J. B. Coles, Hon. Mr. J. N. Campbell, Messrs. A. J. Denison, Geo. Kent Deaker, Joseph Fraser, Wm. Forsythe, R. A. Galton, H. O. Hoseason, F. G. A. Lane, H. V. Masefield, T. C. Huxley, Gordon Pyper, A. Philip, J. P. E. Ryan, H. B. Roberts, J. H. Renton, Edgar Turner, A. Melville White, A. E. Wright, F. M. Muckwood, G. H. Alston, E. C. Skrine, E. M. Shattock, J. A. Henderson, David Kerr, Edward Rosling, W. Saunders,

For part of the year Messrs. W. D. Gibbon, A. T. Rettie, John H. Starey, H. Cumberbatch, W. H. Figg, Gordon Frazer served as members.

Finances.

The total collections paid into the Ceylon Tea (New Markets) Fund on account of the export duty on Tea from January to 31st December, 1899, amount to Rs. 255,693·50. The balance in the Bank, brought forward from 1898, was Rs. 122,745·03.

The usual summary of accounts for the half-yearly periods ending 30th June, 1899, and 31st December, 1899, with various connected statements of Charges and Discharges, are appended.

Minutes of Proceedings.

The Minutes of Proceedings of the Meetings of the "Thirty Committee" have been regularly forwarded to Government for information and guidance after confirmation.

Governor in Executive Council.

During the year the approval of the Governor in Executive Council was obtained to the following appropriations of the proceeds of the levy as from time to time desired and determined by the "Thirty Committee."

	Credit opened for
1. Ceylon Tea in Germany.—Repayment of duty in connection with the original grant of 5,000 lbs. Ceylon Tea for free distribution in Germany per letter dated 21st February, 1899	Rs. 2,375·24
2. Ceylon Tea in Norway.—Repayment of Customs duty on Tea granted for free distribution in Norway per letter dated 21st February, 1899, £26	389·24
3. Ceylon Tea in Russia.—Cost of Pictorial advertisements of Ceylon Tea distributed over Russia granted to Mr. Rogivue per letter dated 21st February, 1899, £40	598·83
4. Ceylon Tea in Russia.—Expenditure for further advertising Ceylon Tea in Russia per letter dated 30th March, 1899, £500	7,500·00
5. "Times of Ceylon" "Art Supplement."—Expenditure in advertising Ceylon Tea per letter dated 2nd April, 1899, £55	825·00
6. Dietetic value of Ceylon Tea.—For expenditure in connection with the printing of Pamphlet on the Dietetic value of Ceylon Tea by M. Kelway Bamber, M.R.A.C., F.C.S., per letter dated 13th June, 1899	500·00
7. Ceylon Tea in Germany.—Expenditure for advertising Ceylon Tea in Germany per letter dated 17th August, 1899, £2,000	30,000·00
8. Representative at Paris International Exhibition, 1900, per letter dated 17th August, 1899, £500	7,500·00
9. Commissioner for the Continent of Europe.—Per letter dated 17th August, 1899, £3,000	45,000·00
10. Presentation to Admiral Dewey.—Amount sanctioned in terms of the Resolution passed by the Committee on 9th September, 1899, per letter dated 14th August, 1899	1,451·60
11. Ceylon Tea in Sweden.—Expenditure for advertising Ceylon Tea in Sweden, per letter dated 22nd September, 1899, £100	1,500·00
12. Ceylon Tea in Manila.—Expenditure for advertising Ceylon Tea in Manila per letter dated 22nd September, 1899, £50	750·00
13. Ceylon Tea on the Continent of Europe. Expenditure for advertising Ceylon Tea per letter dated 29th December, 1899, £10,000, say ...	150,000·00
14. Representative in America.—Expenditure for pushing and advertising Ceylon Tea in America per letter dated 29th December, 1899, £10,000, say	150,000·00
	Rs. 398,389·91

In the list of appropriations noted in the previous year, to which the approval of the Governor in Executive Council was obtained during 1898 should have been included a sum of £500 sterling to be devoted to pushing Ceylon Tea amongst the Green Tea drinkers of Canada per letter dated 28th June, 1898.

CEYLON TEA IN AMERICA.

The total amount of money shown by the accounts in Ceylon appropriated by Mr. Wm. Mackenzie, Representative in America, since the commencement of his operations in 1894, aggregated as at 31st December, 1899, Rs. 811,862·11.

For the year 1900 the amount voted to Mr. Wm. Mackenzie as Representative in America is £10,000, say Rs. 150,000, for pushing and advertising Ceylon Tea. Accounts as received from Mr. Wm. Mackenzie during the past year are annexed.

IN CONTINUATION OF THE TABLES GIVEN IN LAST YEAR'S REPORT, THE FOLLOWING STATISTICS ARE INSTRUCTIVE.

Extracted from year-book of the United States Department of Agriculture.

TEA, COFFEE, AND LIQUORS.

Consumption of Tea, Coffee, Wines, Distilled Spirits, and Malt Liquors in the United States, per capita of population, 1870 to 1898.

"MR. WM MACKENZIE RECENTLY REPORTING ON THE PAST YEAR'S WORK WRITES.

In sending you a general report on our work in America last year, I necessarily, in a great measure, repeat what I have said during the last few years. Our methods are the same as a whole although many new detail experiments have been tried, when members of the trade suggest them as likely to be useful in their districts; and our best and strongest allies are those who have worked with us for four years. That they have continued to do so in the face of the very disheartening blows the tea trade has received during the last three years,—the increase the rejection for many months of all fine teas under the stove test, the heavy duty imposed last year and the cheapness of coffee, proves that some success has attended our efforts.

Some weak friends have dropped out, but many new ones have appeared for help. With India's aid practically withdrawn, and cut in the matter of newspapers, and with Ceylon's appropriation reduced to £6,000, I was obliged to warn our friends that I could not assist them in 1900 to the extent I have been doing. But your Chairman has now told me the £6,000 is to be raised to £10,000, and I have already sent the encouraging news to America.

In my report, written a year ago, I ventured to hope that Ceylon teas would be taken to the extent of 8,000,000 lbs. in 1899, in the States and Canada. The figures for December are not yet known. But we know enough to lead us to believe the estimate I made was fairly correct.

From Colombo direct, and by China, the export will probably be ... ... 4,500,000 lbs.

To end of November, Messrs. Gow, Wilson and Stanton have kindly furnished me with the exports from London to America as ... 3,175,000

Total... 7,675,000

Taking the export from London during December at the average during the first 11 month's or almost 300,000 lbs., then my estimate of 8,000,000 lbs. is very nearly touched.

Tea drinking in the States fell to a very low ebb between June, 1898, and June, 1899; but during the last half year, the deliveries show a great improvement. The figures must be received with caution although official; as I have got them, they run as follows:—

In June ...	...	5,800,000 lbs.
„ July ...	...	7,097,000 „
„ August ...	...	7,143,000 „
„ September ...	...	8,698,000 „

I have applied for figures for October and November, but have not yet received them. In a Grocery Newspaper I see them stated for October at 9,000,000 lbs. Those deliveries are for the States only, and do not include Canada. They would seem to indicate that because of the great prosperity of all industries, the Americans are getting over the shock caused by the imposition of duty.

So far as I can ascertain, the figures for Indian tea will also show a good increase over any previous year.

Teas for price seem to have the call everywhere. It certainly is so in the States. Ceylons partly, but Indians to a much greater extent, on account of the cheapness of some grades from Sylhet, Cachar and the Dooars, have been helped by the rise in price of China blacks, caused by the "Standards," which keep out the lowest grades. Three years ago those China teas were landed in N. York at 4d. to 5d. per lb., now they cost 6d. to 6½d.

Our teas are displacing those China varieties in blends; and it is in that direction, and in packets of pure Ceylon and Indian, now being pushed vigorously wherever people of British origin are to be found in the States, that our trade is increasing. My enquiries have failed to find evidence that we are converting Americans to the use of straight black tea, to an extent that would materially help our exports.

As I began by saying, this is a *general* report, I cannot enter into details without giving away business, which would offend our friends. But the Chairman will support me in saying that week by week I keep him and the Committee fully informed of *nearly* everything that is going on. I say *nearly*, because with so many Colombo merchants on the Committee, I am forced to be silent on points concerning Firms who are helping us from Colombo.

The *Daily Mail* has the following para this morning: "The Boers'" Ambulance of Colesburg is a grocer's wagon and has a red cross painted on it next the Grocer's name, and "Drink Ceylon Tea" on the other side.

PRESENTATION OF AN ADDRESS AND SILVER CASKET CONTAINING CEYLON TEA TO ADMIRAL DEWEY, OF THE UNITED STATES NAVY, ON HIS ARRIVAL AT COLOMBO IN JUNE, 1899.

In reference to the incident of the visit of the Hero of Manila to Ceylon in 1899 *en route* to America, where he afterwards was the recipient of one of the most enthusiastic and remarkable demonstrations from his countrymen on record, it is worth reproducing here a copy of the telegram on the subject that appeared in the *New York Tribune* and in the *Chicago Record* at the time as showing how widely known the Reception was throughout America. All the members of the Deputation were impressed with Admiral Dewey's cordiality and the personal interest he so distinctly evinced in Ceylon's great staple—Tea—and the British enterprise under which it flourished.

CEYLON GREEN TEAS.

With regard to the grant of 10 cents per lb. on Ceylon Green Teas, the following statement, from the commencement to date, may be useful for reference.

				R.	c.
October	1898...	2010 lbs.	Tillyrie Green Teas	201	00

	Total..	99629 lbs.		Total Rs...	9962	90

Leaving the balance of Rs. 20,037·10 still available at date.

AGRICULTURAL CHEMIST.

The interesting work commenced by Mr. M. Kelway Bamber in October, 1898, was brought to a point by your Committee receiving an elaborate report which is being printed under Mr. Bamber's directions, and which will be issued free on application to every tea estate.

UNIVERSAL INTERNATIONAL EXHIBITION TO BE HELD IN PARIS IN THE YEAR 1900.

Mr. J. H. Renton has been appointed representative at the Paris Exhibition at a salary of £500 sterling, and it is felt that in his hands nothing will be left undone to ensure the best results which the opportunity should afford of making Ceylon Tea known to all the nations of the world who will doubtless visit the French Capital on this great occasion.

CEYLON TEA IN RUSSIA.

Members will recollect that on Mr. Christie's recommendation a contract was entered into for advertisements appearing once a week for 35 weeks, that is to the end of May, 1899, in 48 Newspapers and 6 Illustrated Periodicals in Russia. The contract has not been renewed, and the total cost of the advertisement has been Rs. 41,814·21. Though no report has yet been received, there need be little doubt that benefit has resulted from such advertisement of Ceylon Tea in Russia undertaken solely on the lines laid down, and with the one object to advertise the merits of Ceylon Tea. The following extract from a Diplomatic and Consular Report (RUSSIA) for the year 1898 is interesting, regarding Agriculture and Trade of Odessa and District. Under the heading Ceylon Tea it is recorded: "Ceylon tea, which was introduced into Russia only a few years ago, is being consumed in rapidly increasing quantities. In 1898 2,714,000 lbs. of tea were shipped from Ceylon direct to Odessa, as against 439,350 lbs. in 1897—a very satisfactory increase. China and Ceylon teas are imported in vessels of the Russian Volunteer Fleet, which, owing to the low freights charged by that line of steamers on their homeward voyages, have now practically the monopoly of the tea carrying trade from Yangtse ports, Shanghai, and Colombo. Moreover, tea imported from the Far East in Russian bottoms enjoys preferential railway rates between Odessa and Moscow.

It is worthy of note that there is a growing reciprocal purchase of Russian petroleum by Ceylon. In 1897, 1,337,400 gallons of this product were imported at Colombo, and last year 1,398,900 gallons."

EXTRACT OF RETURN OF PRINCIPAL ARTICLES OF IMPORT TO ODESSA DURING THE YEARS 1898—96.

Articles.	Tons.	1898.	1897.		1896.	
			Quantity	Value.	Quantity	Value.
				£		£
Tea...	Tons.	2,344	1,933*	257,780	1,490	202,200

* Exclusive of upwards of 1,700 tons in bond at Odessa.

In addition to the above further and later particulars received at Foreign Office, November 18th, 1899, from the same source, are given thus. "The imports of Tea have again increased, the quantity received at Odessa for local consumption in 1898 being 5,232,780 lbs, representing an augmentation of 917,604 lbs, exclusive of Tea in bond in warehouses. Tea imported up to a recent date, via London, destined for Moscow and other towns in the interior, now passes in transit through Odessa. This is due to the increased activity of the Volunteer Fleet, which, aided by preferential railway freights in Russia, has secured the monopoly of the Tea carrying trade between the Far East and Odessa. Customs returns estimate the quantity of Tea imported into Russia at 118,000,000 lbs, and show an increased importation over 1897 of 4,890,600 lbs passing through Odessa in transit. Trade in Ceylon Teas continues to flourish, the quantities imported steadily increasing from year to year. Up to the present only cheap Teas have been found profitable, the heavy duty on Tea excluding the higher qualities from the market; but the increase of duty on Tea crossing the Eastern frontier by the overland route from 19 rs. 50 a. to 22 rs. 50 a. per pood (36 lbs), will doubtless favour the trade in Ceylon Teas which enter Russia by sea. The fact that a Russian firm has opened a branch office in Colombo augurs well for the future trade in Ceylon Teas, which were introduced into Russia only a few years ago for blending with China Teas."

Adverting to Mr. Christie's first recommendation in his valuable Report, namely to endeavour to get the Russian Import Duty on Tea reduced as the greatest aid to increased consumption, and in continuation of correspondence given in last year's Report in Appendix A, the following important further communication is herein added. It should be noted that by a printer's mistake the letter from Government referred to was given as dated "Colombo, 17th January 1898," instead of as "Colombo, 17th January, 1899." This correction is noted to guide in looking over the earlier letters on the subject of the Duties levied on Tea by the Russian Government.

Colonial Secretary's Office,
Colombo, 25th August, 1899.

SIR,

Adverting to my letter of the 17th January, 1899, forwarding for the information of the Planters' Association a copy of a Despatch from the Secretary of State for the Colonies, together with a copy of a communication from Her Majesty's Ambassador at St. Petersburg, on the subject of the duties levied on tea by the Russian Government, I am directed by His Excellency the Lieut.-Governor to forward, for the information of your Association, a copy of a Despatch received through the Secretary of State from Her Majesty's Ambassador at St. Petersburg to the Marquess of Salisbury reporting certain alterations in the duties payable on imported tea under the Russian Customs Tariff.

I am, Sir,
Your obedient Servant,
J. J. THORBURN,
for Colonial Secretary.

The Secretary,
Planters' Association
of Ceylon.

(*Copy referred to.*)

Copy No. 97, Commercial. St. Petersburg, July 12th, 1899.

MY LORD,

I have the honour to report that, according to a decision of the Council of the Empire, passed on the 4th/16th June, 1899, and published in the Bulletin of Laws of the 25th June-7th July, 1899, the following alteration under the Russian Customs Tariff in respect of the duty payable on tea are decreed:—

1.—Brick Tea, Black and Green, imported into Russia across the European frontier to pay duty at the rate of 11 Roubles 25 Copecks per poud (former duty 31 Roubles 50 Copecks per poud.)

2.—Black, flower, green and yellow teas imported at the frontier of the Steppe, Irkutsk and Ust-Amur Governor Generalships to pay duty at the rate of 22 Roubles 50 Copecks per poud. (Former duty 19 Roubles 50 Copecks per poud.)

With the completion of the Russian lines of rail to the Pacific the rates of duty on tea will be subject to further consideration.

I have, &c,
(Signed) CHARLES S SCOTT.

The Marquess of Salisbury, K. G.
&c., &c.

CEYLON TEA IN GERMANY.

A sum of Rs. 31,752·61 has been paid in connection with pushing and advertising Ceylon Tea in Germany during the past year almost entirely by the efforts of Messrs. Hagenbeck & Co. It has been decided now as regards the year 1900 that all fresh expenditure must be sanctioned by Mr. J. H. Renton as the Representative of the Committee on the Continent of Europe, though in the opinion of the Committee the methods adopted have been novel and popular. Early in the past year Mr. J. P. Ryan as representing the Committee had the distinguished honour of being received by His Imperial Majesty the Emperor of Germany and of presenting a special silver mounted chest of fine Ceylon Tea, which was graciously accepted, while at the same time the opportunity was availed of to bring under notice the gift of 5,000 lbs. Ceylon Tea for distribution to German Regiments. A hearty vote of thanks was passed to Mr. Ryan for his services, and for the manner in which he had carried out the duties entrusted to him in the matter.

CEYLON TEA ON THE CONTINENT OF EUROPE.

The post of Commissioner for the Continent of Europe was offered to, and has been accepted by, Mr. J. H. Renton for a period of three years at a salary of £1,000 per annum, to cover all expenses, while a further sum of £10,000 sterling has been voted to be expended by Mr. Renton in pushing and advertising Ceylon Tea under the following heads: Paris Exhibition £1,000; in France £6,000; in Germany £2,000; in Austria £500; in Holland £300; in Scandinavia £300.

CEYLON TEA IN SWEDEN AND NORWAY.

It will be remembered that it was decided to present to His Majesty the King of Sweden and Norway ten boxes of fine Ceylon Tea on the auspicious occasion of His Majesty's Seventieth anniversary of his Birthday. The Tea was packed in handsome silver bound boxes made of the various kinds of the finest Ceylon woods, and the gift was very graciously accepted by His Majesty, and his best thanks conveyed early in 1899.

COOLGARDIE EXHIBITION, 1899.

The accounts submitted by Mr. A. P. Waldock, who was in charge of the Tea and other exhibits from Ceylon at the Coolgardie Exhibition, are annexed. It seems doubtful whether the Advertisement obtained was proportionate to the expenditure, though doubtless the best was made of the Exhibition for pushing and advertising Ceylon Tea.

ADVERTEING CEYLON TEA BY PHOTOGRAPHS IN THE RAILWAY CARRIAGES OF THE GOVERNMENT RAILWAY.

The idea of availing of the inside of railway carriages for exhibiting views of interesting and attractive scenery is not new, is it is carried out in many railways elsewhere—but nothing of the kind has been attempted in Ceylon; it is therefore gratifying to report that His Excellency the Governor favours an approved scheme being tried on the Government railway. The General Manager will be glad to co-operate, and it is accordingly intended to make use as early as possible of the excellent photographs depicting the Ceylon Tea Industry lately selected in connection with the Paris Exhibition. There can be no doubt that the attention of the numerous visitors who travel by the railway will be drawn to the pictures, and lead to enquiry and greater interest in Tea, its cultivation, and manufacture in "Sunny Ceylon."

THE DIETETIC VALUE OF CEYLON TEA.

Mr. M. Kelway Bamber's Pamphlet on the Dietetic Value of Ceylon Tea has been widely circulated, and cannot fail to create interest, and to draw attention to the important subject dealt with.

[Coffee Futures (like cotton) have risen 50% in value. The Bears have had their Waterloo. Coffee which has been declining five years should keep up the next three years.

Sugar :—Views are mixed but tendency rather bearish. Wheat should rise from present low prices.]

COCOA.

"Shanghai."—OO MAK in estate mark, 10 bags sold at 75s ; 4 bags sold at 65s 6d ; sea damaged and bulked ; ditto 45 bags sold at 75 ; ditto 13 bags sold at 65s 6d ; sea damaged and bulked; ditto A MK in estate mark, 35 sold at 70s 6d.

CEYLON COFFEE SALES IN LONDON.

(From Our Commercial Correspondent).

MINCING LANE, Jan. 26.

"Orissa."—WAG P, in estate mark, 3 casks and 1 barrel out at 44s, 41s refused.

Coffee closed firm for futures, which are 50 per cent dearer than the lowest, and we still expect to see prices dearer and for the next three years. News from China, Northern Afghanistan and Warren look serious. Wheat should rise. Cotton Manchester strong.

CEYLON COFFEE SALES IN LONDON.

(From Our Commercial Correspondent).

MINCING LANE, Feb. 23rd.

"Hakata Maru."—GA Ouvah A, 1 barrel sold at 108s; ditto 1, 1 cask sold at 104s; ditto 2, 5 casks and 1 tierce sold at 90s; ditto 3, 2 casks and 1 barrel sold at 65s; ditto 1 PB, 1 tierce sold at 103s; JB Ouvah 1, 1 cask sold at 103s; ditto 2, 3 casks sold at 87s; ditto 3, 1 tierce sold at 56s; ditto 1 PB, 1 barrel sold at 85s.

"Patroclus."—Meeriabadde F, 1 barrel sold at 110s; ditto 1, 1 cask and 1 barrel sold at 106s; ditto 2, 4 casks sold at 91s; ditto 3, 1 tierce sold at 59s; ditto PB, 1 cask sold at 118s; MB T, in estate mark, 1 barrel sold at 40s; Meeriabedde, 1 bag sold at 77s.

"Java."—MDS O, 2 casks and 1 barrel sold at 60s; ditto 1, 4 casks sold at 53s; ditto 2, 2 casks

sold at 44s; ditto PB, 1 barrel sold at 55s; ditto T, 2 casks and 1 barrel sold at 41s; MDS, 3 barrels sold at 43s; ditto T. 1 barrel sold at 34s.

"Patroclus."—Poonagalla A, 1 barrel sold at 114s; ditto B, 3 casks sold at 193s; ditto C, 1 tierce sold at 63s; ditto PB, 1 tierce sold at 122s.

COFFEE (Santos) closed firm. This article is still digesting the 60 per cent. rise. Regarding the size of mild coffee crops in Central America, We hear from good judges that all the Central American ports will be short this year, so later on we again anticipate higher prices. Maize, corn, and oats should rise. Wheat depends on the weather as stocks, are heavy. Cotton, the next crop may be 10,000,000 to 15,000,000 bales. American sugar looks tired as stocks are too big.

CEYLON COCOA SALES IN LONDON.

"Shropshire."—Palli, London 1, 24 bags out at 92s, 85s refused; ditto T, 10 bags out; ditto 2, 6 bags sold at 63s 6d; ditto T, 2 bags sold at 60s 6d.

"Hakata Maru."—A Grove, London, 43 bags out; ditto C, 2 bags sold at 71s 6; ditto L, 2 bags sold at 61s; MA D B & Co., KI, in estate mark, 20 bags out at 73s, 63s refused.

"Machaon."—MS in estate mark, Estate Cocoa, 90 bags sold at 68s.
